

Tetraquark candidate $Z_c(3900)$

from coupled-channel scattering

-- how to extract hadronic interactions? --

Yoichi Ikeda (RCNP, Osaka University)

HAL QCD (Hadrons to Atomic nuclei from Lattice QCD)

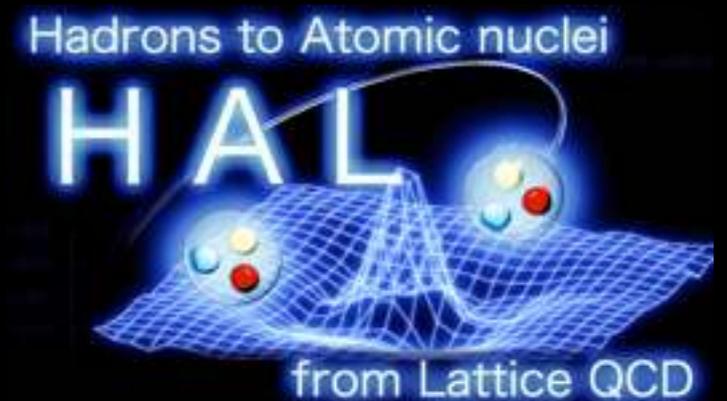

S. Aoki, T. Aoyama, D. Kawai, T. Miyamoto, K. Sasaki (YITP, Kyoto Univ.)

T. Doi, T. M. Doi, S. Gongyo, T. Hatsuda, T. Iritani (RIKEN)

Y. Ikeda, N. Ishii, K. Murano, H. Nemura (RCNP, Osaka Univ.)

T. Inoue (Nihon Univ.)

F. Etminan (Univ. of Birjand)

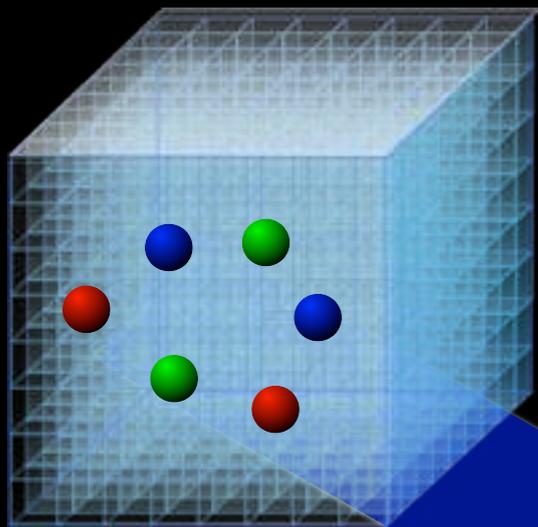

Lattice2017

35th INTERNATIONAL
SYMPOSIUM ON
LATTICE FIELD
THEORY

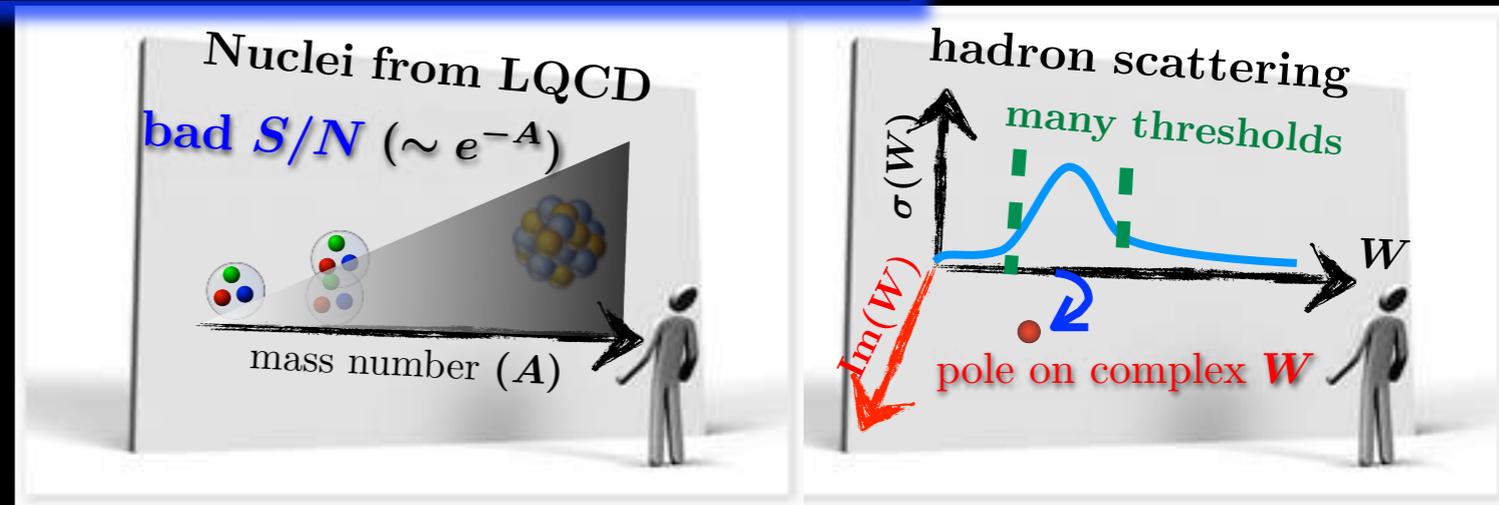

18-24 JUNE 2017
GRANADA - SPAIN

Strategy: from quarks to nuclei & neutron stars

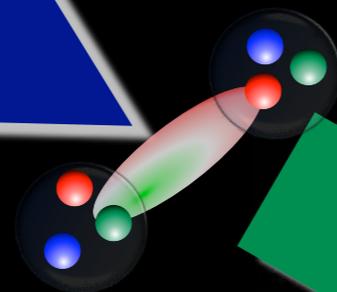

hadronic interactions

Physical point simulations (Doi, Ishii, Sasaki, Nemura)

Problems in plateau method (Aoki, Iritani)

conventional resonance (Kawai)

hadron resonance

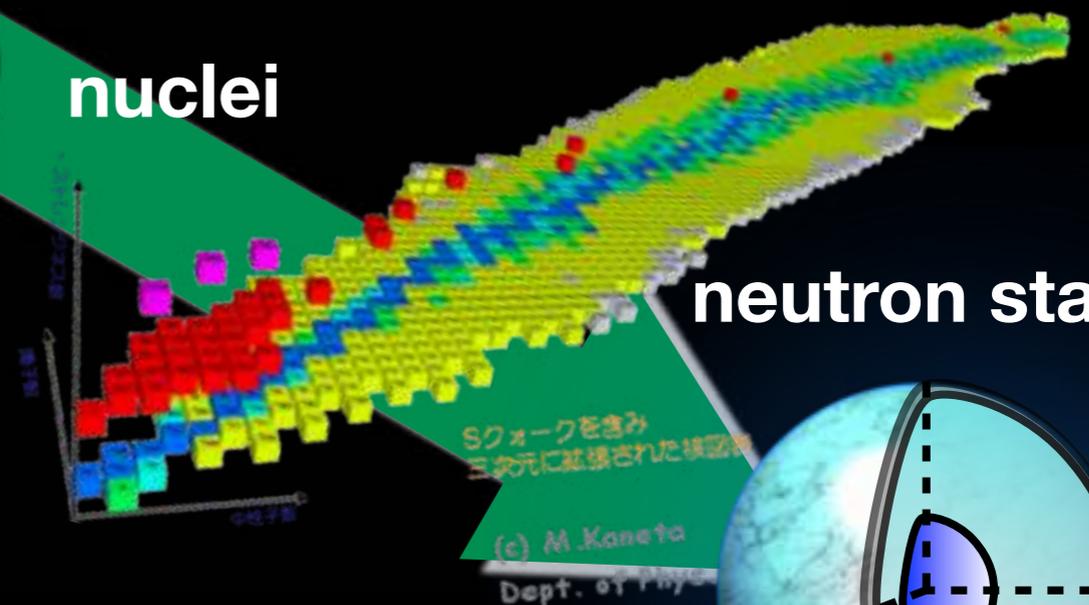

nuclei

Part I: hadronic interactions

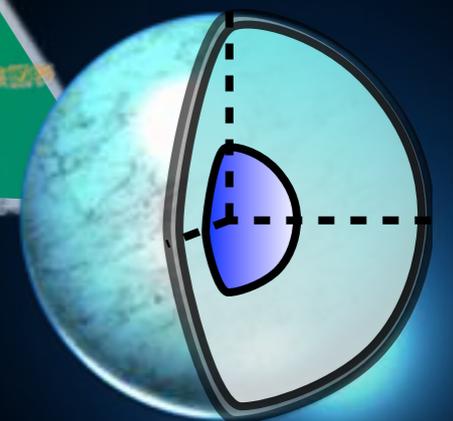

- difficulties in baryon-baryon systems
- solution = HAL QCD method

Part II: coupled-channel & resonances

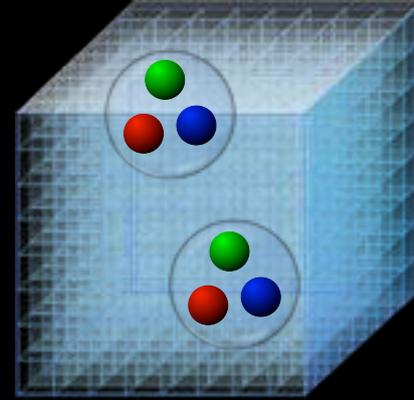

- coupled-channel scattering from LQCD
- nature of tetraquark candidate $Z_c(3900)$

neutron stars

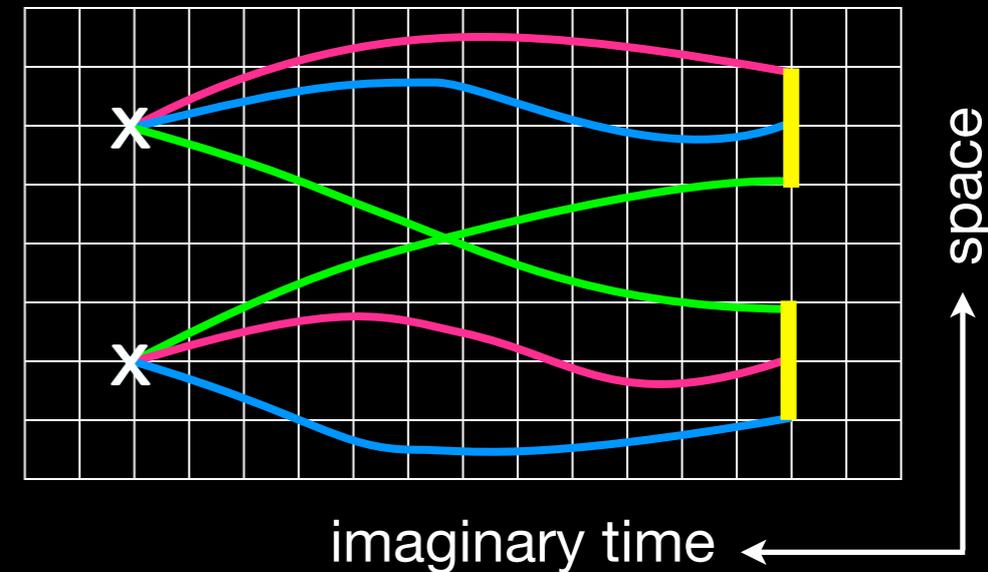

Scattering observables

Hadronic interactions faithful to QCD S-matrix

$$C_{NN}(\vec{r}, t) \equiv \langle 0 | N_1(\vec{r}, t) N_2(\vec{0}, t) \mathcal{J}^\dagger(t=0) | 0 \rangle$$
$$= \sum_n A_n \psi_n(\vec{r}) e^{-W_n t}$$

Energy eigenvalues $W_n(L)$ & NBS (Nambu-Bethe-Salpeter) wave functions $\psi_n(r)$

• Lüscher's Method

▶ $W_n(L)$ --> phase shift, binding energy

Lüscher, Nucl. Phys. B354, 531 (1991).

➔ Serious difficulty to measure $W_n(L)$
in BB systems

• HAL QCD Method

▶ $\psi_n(r)$ --> **2PI kernel** ($\psi = \varphi + G_0 U \psi$)

--> phase shift, binding energy

Ishii, Aoki, Hatsuda, PRL 99, 022001 (2007).

Ishii et al. [HAL QCD], PLB 712, 437 (2012).

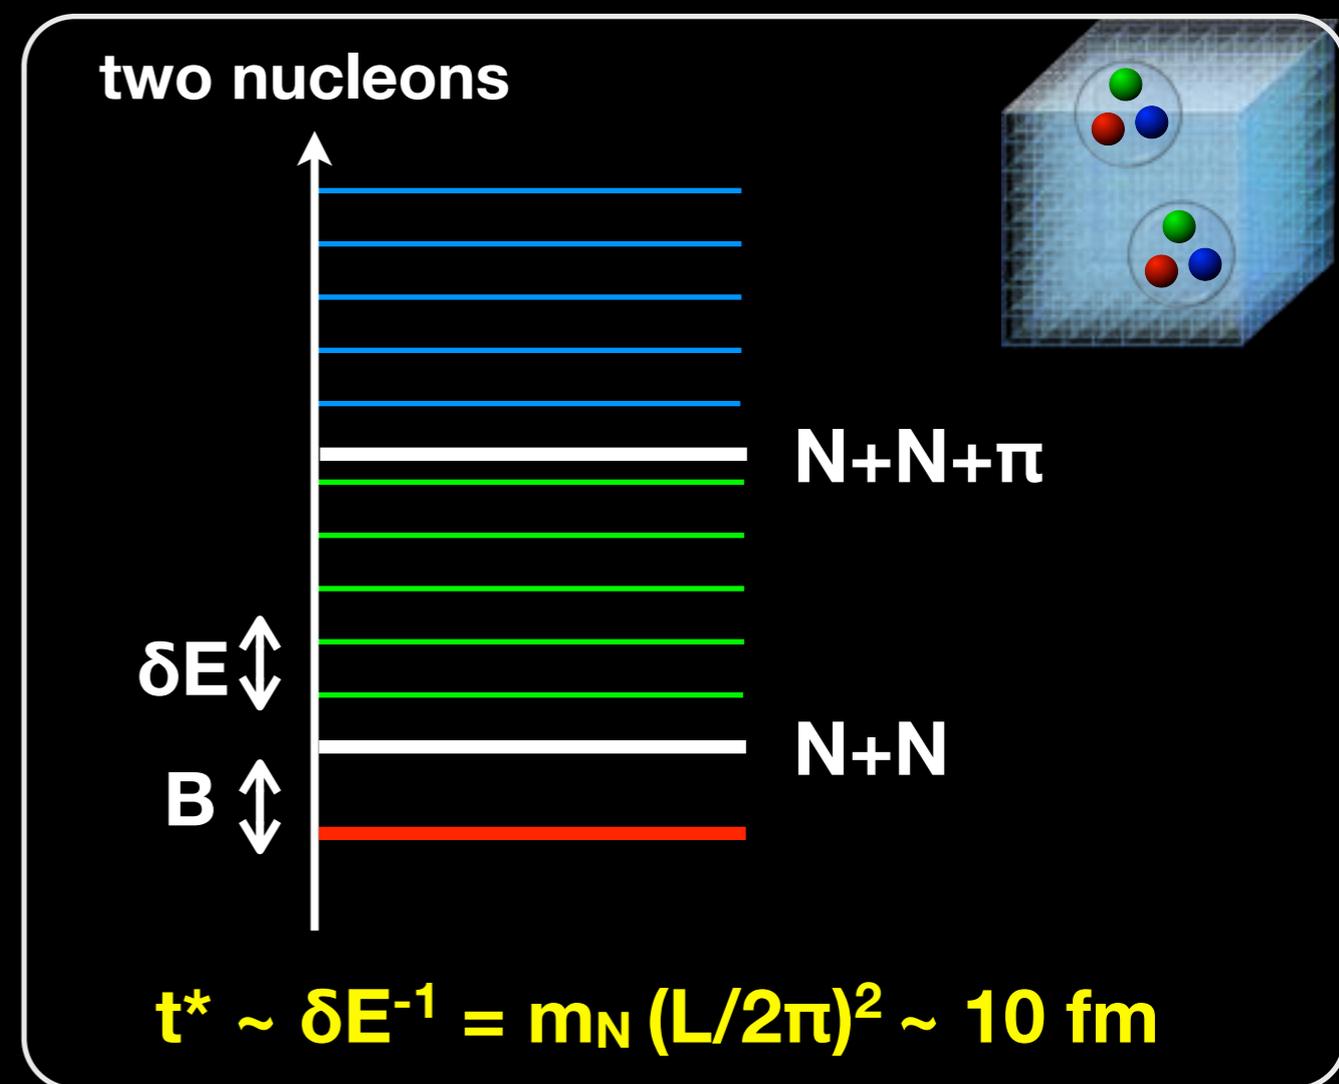

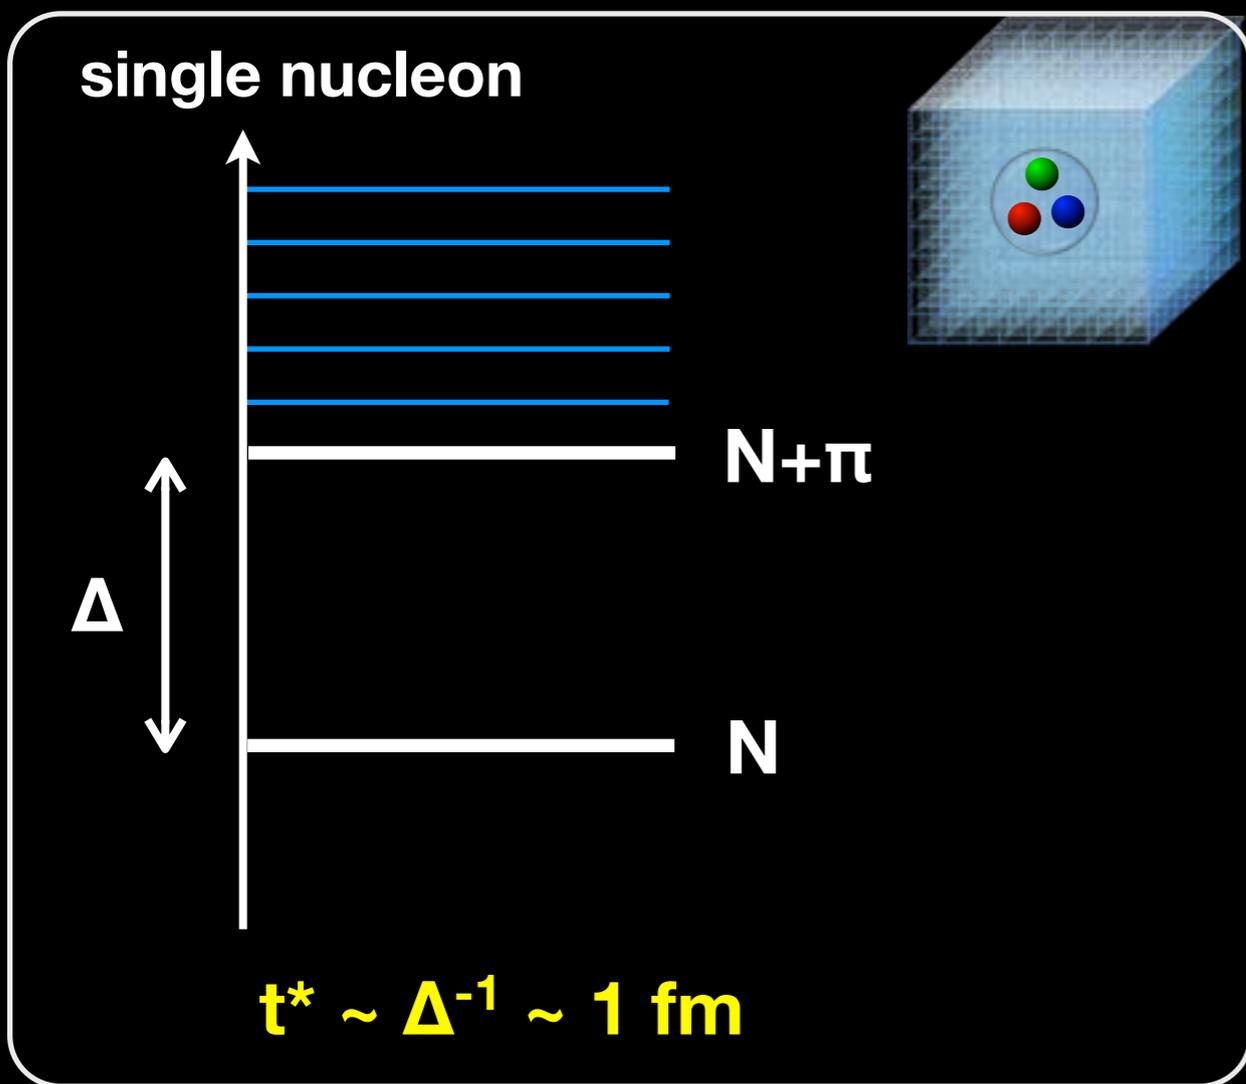

Challenge in multi-baryon system (S/N issue)

$$C_N(t) = a_0 e^{-m_N t} + a_1 e^{-(m_N + m_\pi)t} + \dots$$

$$\longrightarrow a_0 e^{-m_N t} \quad (t > t^*)$$

$$C_{NN}(t) = b_0 e^{-W_0 t} + b_1 e^{-W_1 t} + \dots$$

$$\longrightarrow b_0 e^{-W_0 t} \quad (t > t^*)$$

$$\mathcal{S}/\mathcal{N} \sim \sqrt{N_{\text{conf.}}} \times \exp [-(m_N - 3/2m_\pi)t^*]$$

$$\sim \sqrt{N_{\text{conf.}}} \times 10^{-2}$$

$$\mathcal{S}/\mathcal{N} \sim \sqrt{N_{\text{conf.}}} \times \exp [-2(m_N - 3/2m_\pi)t^*]$$

$$\sim \sqrt{N_{\text{conf.}}} \times 10^{-32}$$

Demonstration of plateau method by mock-up data

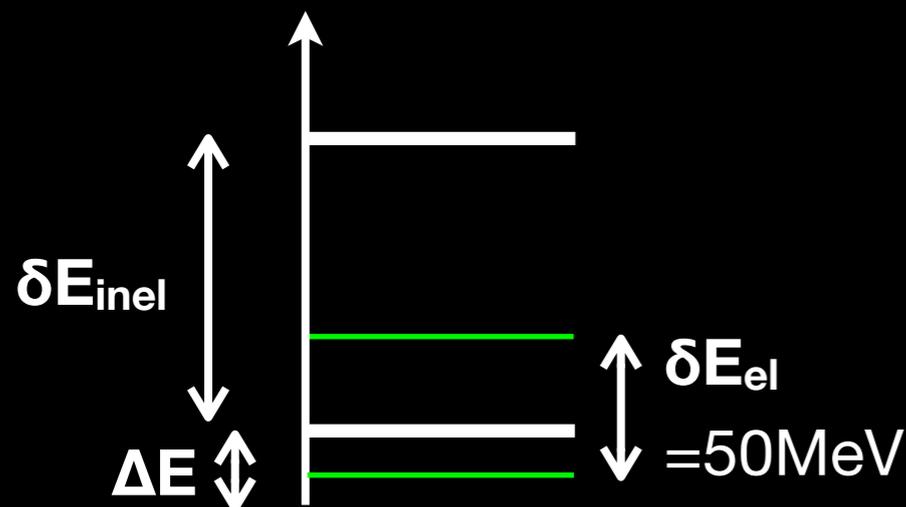

“Mirage in temporal correlation functions for baryon-baryon interactions in lattice QCD”

Iritani, Doi et al. [HAL QCD], JHEP10 (2016) 101.

- Normalized correlation func. $R(t)$ for two baryons

$$R(t) = \frac{C_{BB}(t)}{C_B(t)^2} = b_1 e^{-\Delta E t} + b_2 e^{-\delta E_{el} t} + c_1 e^{-\delta E_{inel} t}$$

$$\Delta E^{\text{eff}}(t) = \log \left[\frac{R(t)}{R(t+1)} \right] \xrightarrow{t > t^*} \Delta E$$

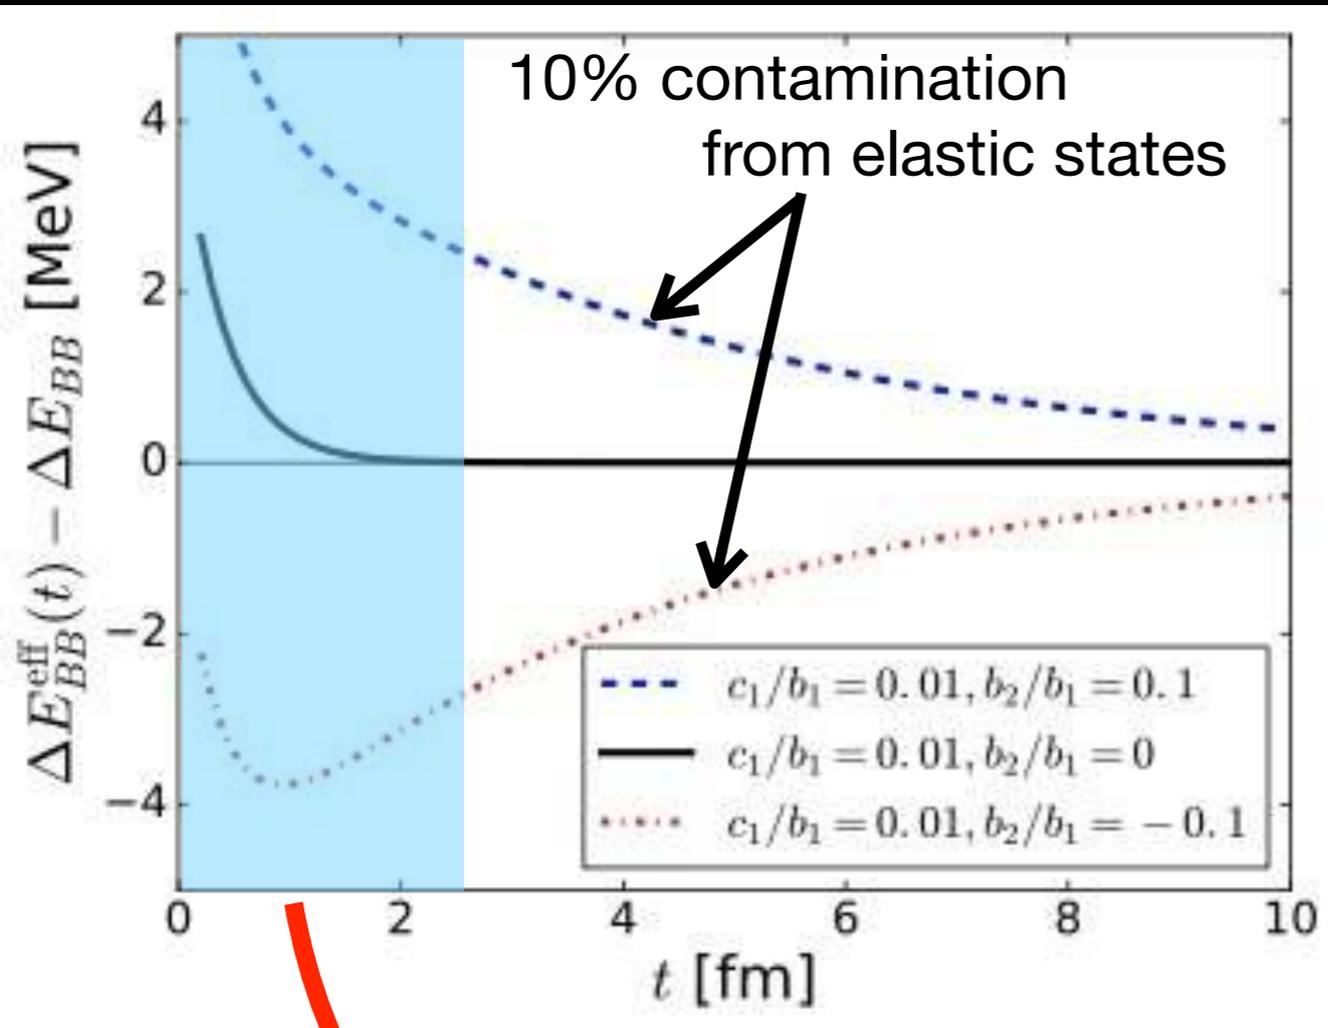

- Ground state energy $\Delta E = W_{BB} - 2m_B$
 $\sim 1 \text{ MeV}$ precision necessary (nuclear physics scale)
- Elastic scattering states δE_{el}
 $\delta E_{el} = 50 \text{ MeV}$, $b_2/b_1 = \pm 0.1, 0$ (10% contamination)
- Inelastic threshold δE_{inel}
 $\delta E_{inel} = 500 \text{ MeV}$, $c_1/b_1 = 0.01$ (1% contamination)

Demonstration of plateau method by mock-up data

“Mirage in temporal correlation functions for baryon-baryon interactions in lattice QCD”

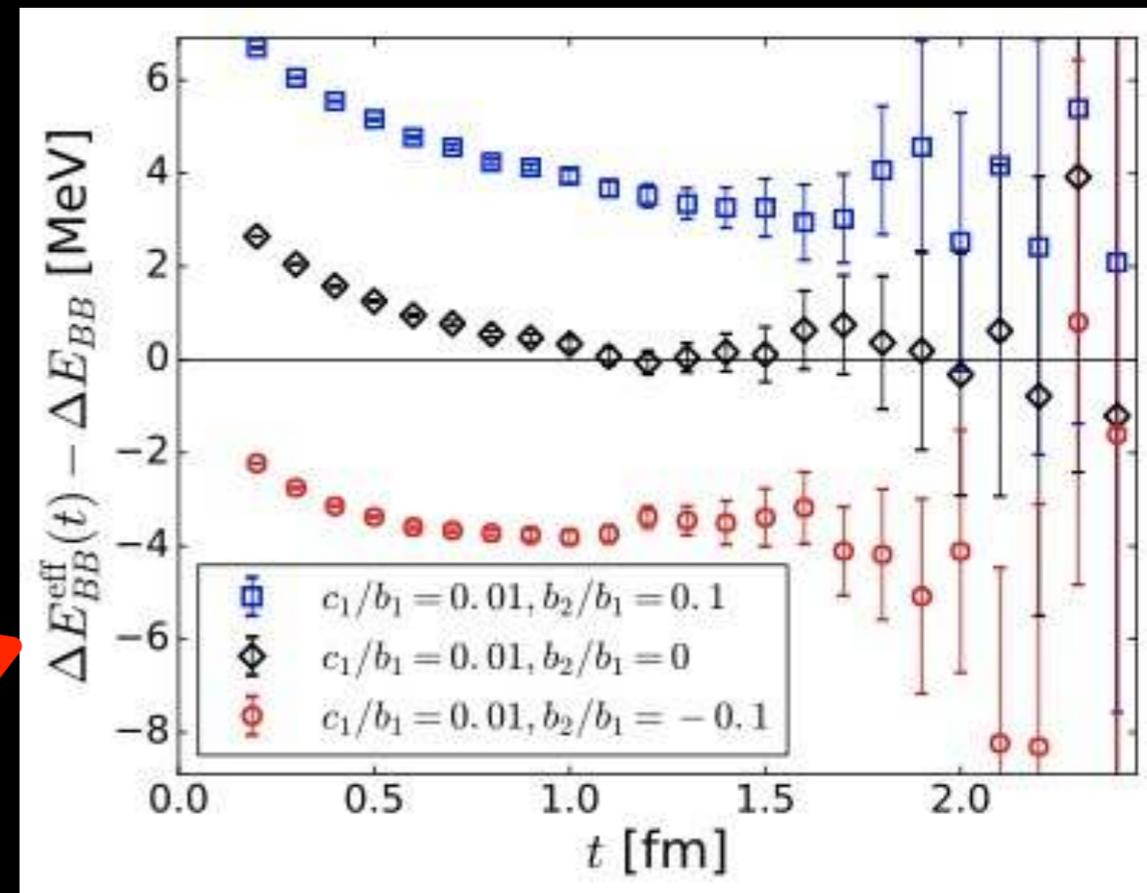

Iritani, Doi et al. [HAL QCD], JHEP10 (2016) 101.

→ True ground state for $t > 8$ fm
with 10% contamination

Fake plateaux or “Mirage” appear
at $t \sim 1$ fm

Zoom + typical stat. error

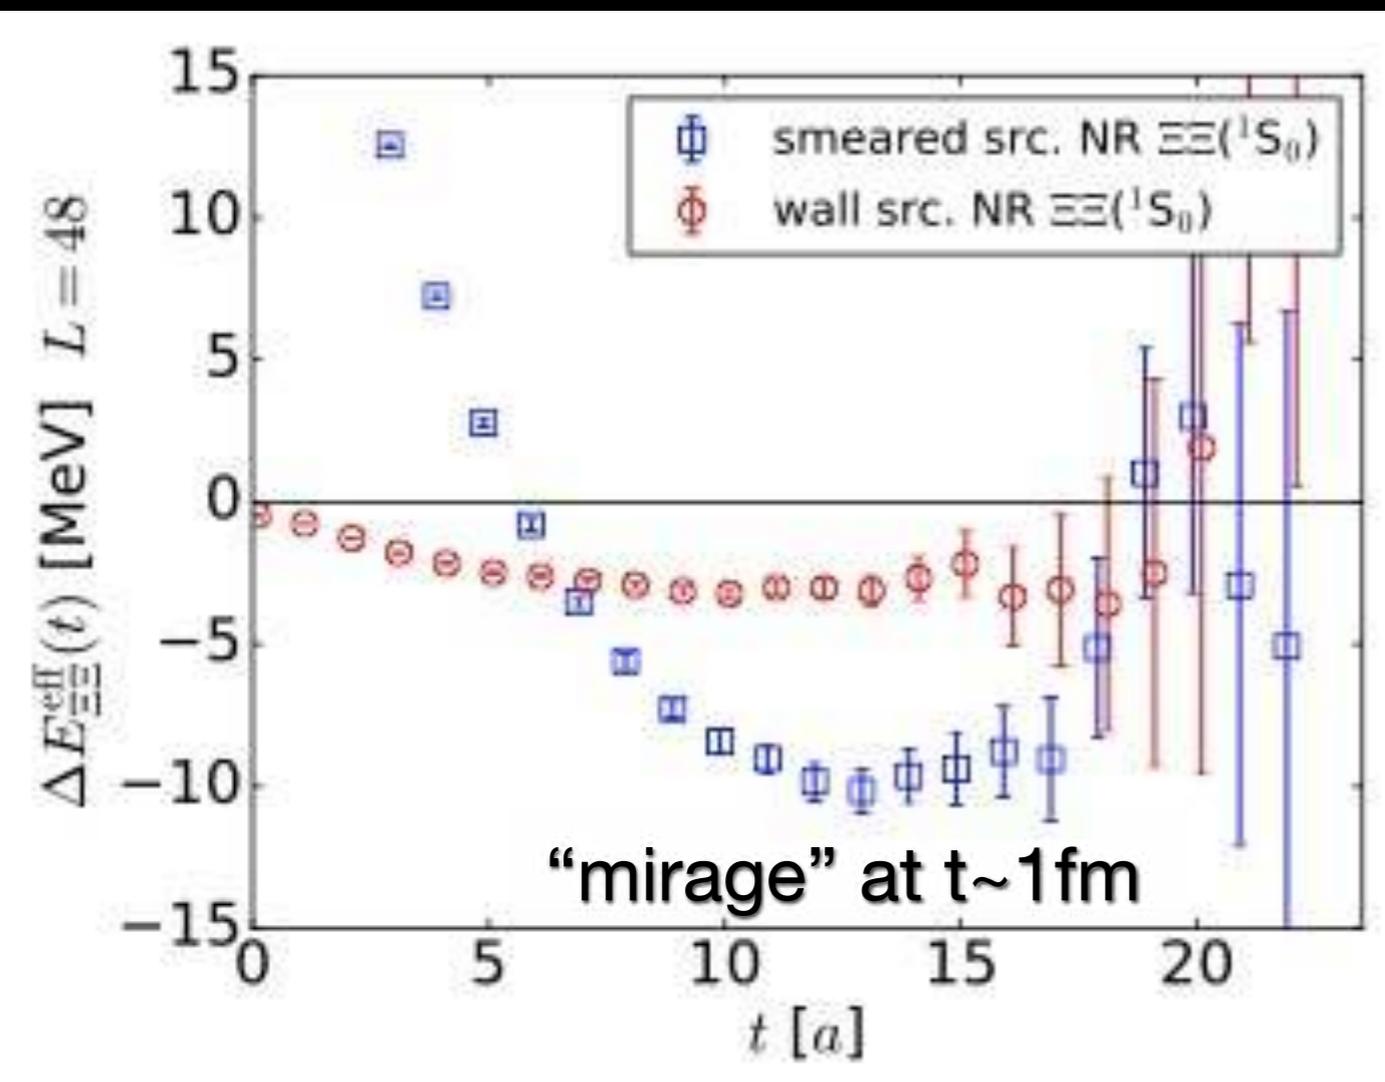

Actual data for $\Xi\Xi$ (1S_0) @ $m_\pi=0.51\text{GeV}$, $L=4.3\text{fm}$, $a=0.09\text{fm}$

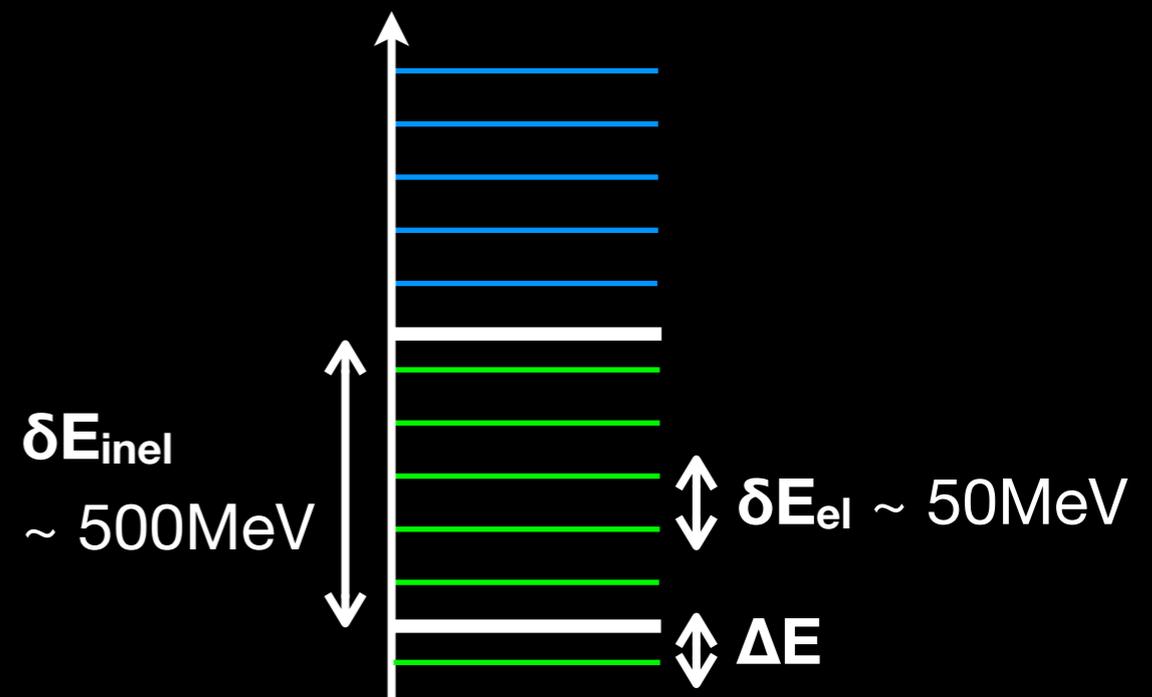

--> same setup as Yamazaki et al. ('12)

Source dependence in plateau method

$$R(t) = \sum_{\vec{x}, \vec{y}} \langle 0 | B_1(\vec{x}, t) B_2(\vec{y}, t) \mathcal{J}^\dagger(t=0) | 0 \rangle / C_B(t)^2$$

$$\Delta E^{\text{eff}}(t) = \log \left[\frac{R(t)}{R(t+1)} \right] \xrightarrow{t > t^*} \Delta E$$

→ True ground state is to appear at $t > t^*$ ($t^* \sim 8\text{fm}$)

- Data at $t \sim 1\text{fm}$ is too early to identify ground state energy
- Both “plateaux” can be fake!

New method to diagnose LQCD data in plateau method

-- “Sanity check” with Lüscher’s finite volume formula --

Our proposal

Iritani et al. [HAL QCD], arXiv:1703.07210.

see also talk by Aoki (Thur.)

1. extract $k \cot \delta(k)$ through Lüscher’s formula

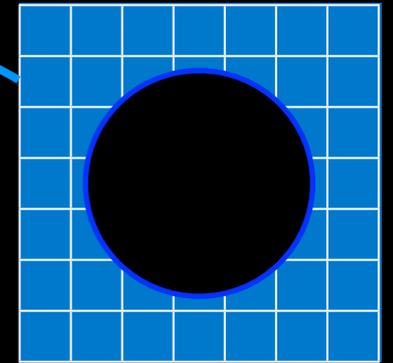

• Lüscher’s finite V formula

▶ energy ΔE --> momentum k --> $k \cot \delta(k)$

$$k \cot \delta(k) = \frac{1}{\pi L} \sum_{\vec{n} \in \mathbb{Z}^3} \frac{1}{\vec{n}^2 - (kL/2\pi)^2}$$

$\psi_k(r > R)$

=> phase shift $\delta(k)$

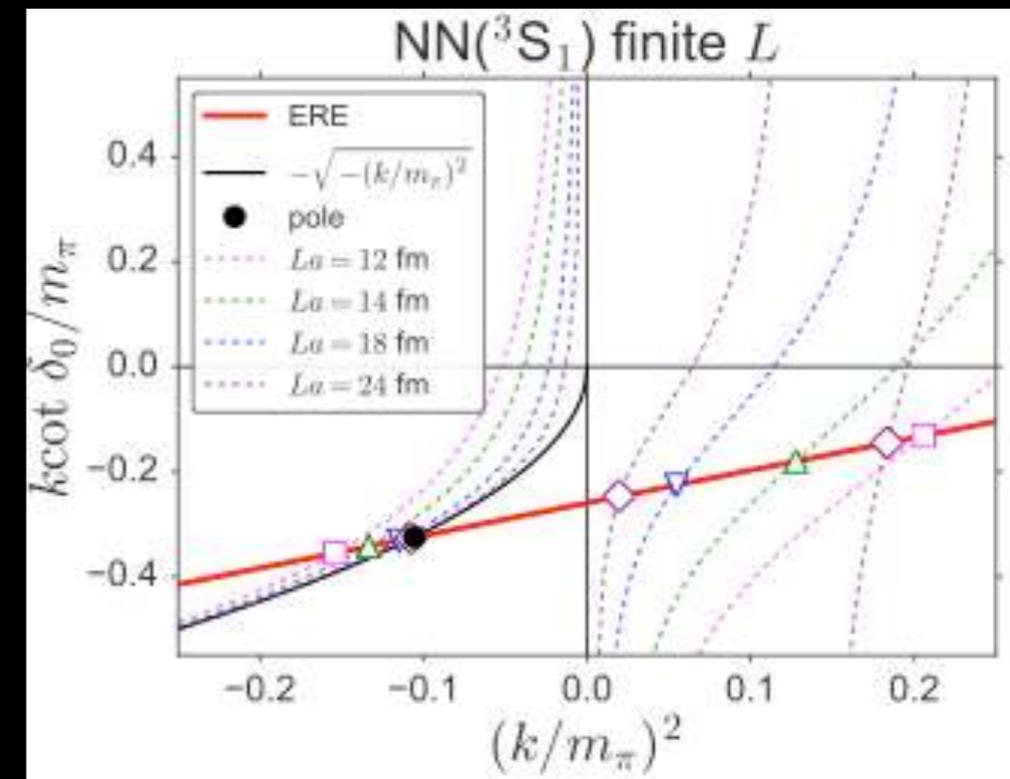

2. combine the results with effective range expansion (ERE)

• Effective range expansion (ERE)

$$k \cot \delta(k) = \frac{1}{a} + \frac{1}{2} r_e k^2 + \dots$$

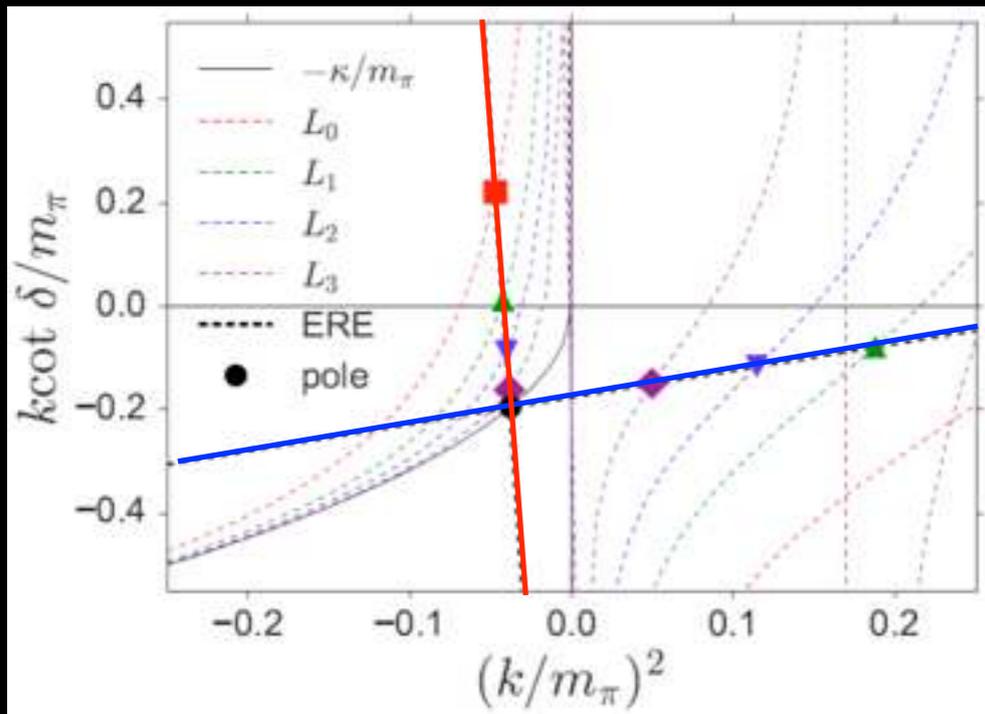

- An example of ERE w/ Lüscher’s formula (dotted lines) for bound state problem
- If the energy is extracted correctly, all data should be aligned on ERE line at low-energy

“Sanity check” for all existing data

Iritani et al. [HAL QCD], arXiv:1703.07210.

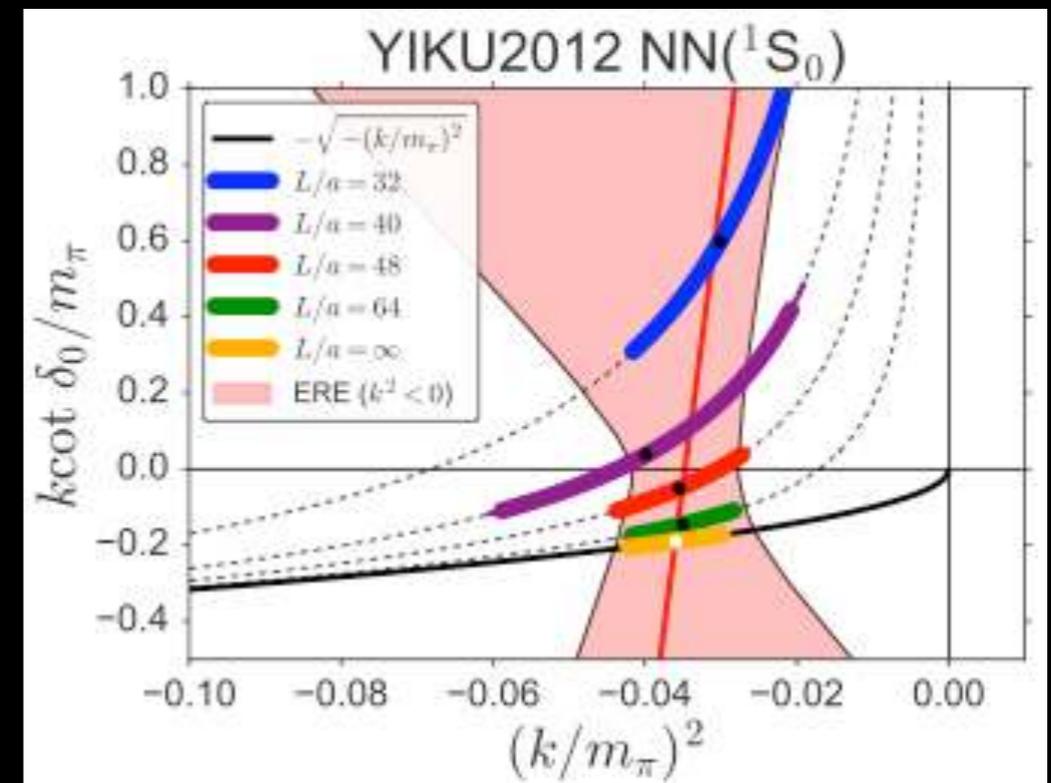

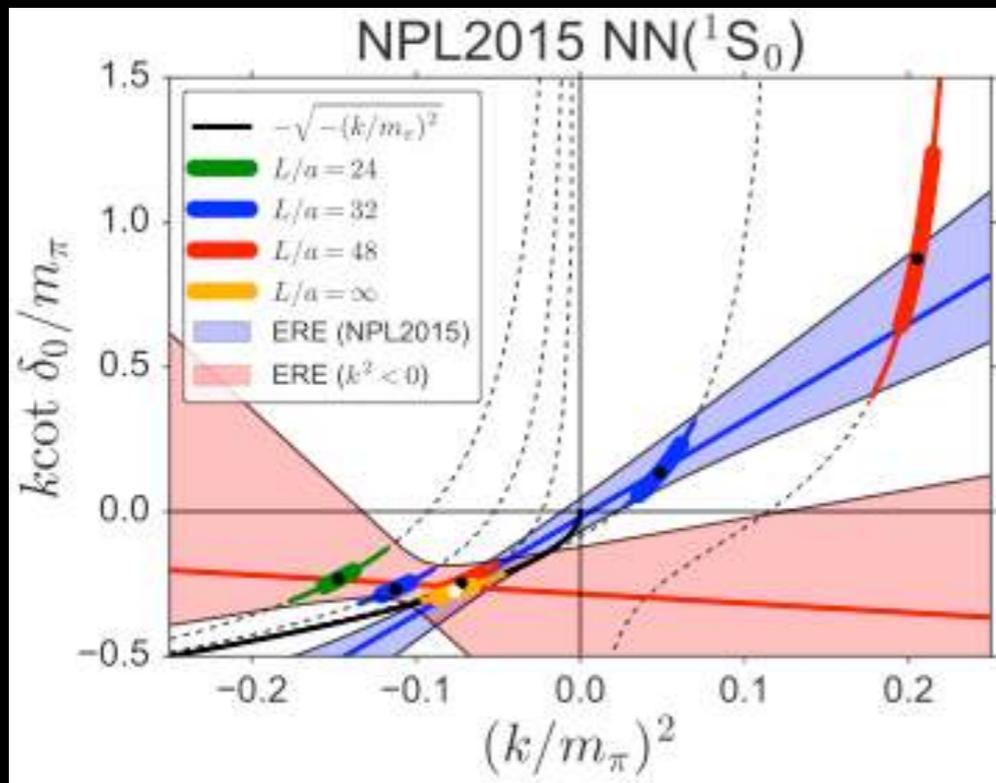

An exotic example

$$k \cot \delta(k) = \frac{1}{a} + \frac{1}{2} r_e k^2 + \dots$$

- (i) inconsistent ERE for $k^2 < 0$ and for $k^2 > 0$
- (ii) singular parameterizations $\longrightarrow r_e \simeq \pm \infty$
- (iii) unphysical residue at pole position

➔ indicate the problem in LQCD data

(i) inconsistent ERE, (iii) unphysical residue

(ii) singular behavior

Summary table (fake plateaux & sanity checks)

Iritani et al. [HAL QCD], arXiv:1703.07210.
+ update [NPL2013 (3S_1), No --> ?]

At least single “No” implies the result is “Mirage” in temporal correlator
(No data has passed these tests so far)

Data	$NN(^1S_0)$				$NN(^3S_1)$			
	Source independence	Sanity check			Source independence	Sanity check		
		(i)	(ii)	(iii)		(i)	(ii)	(iii)
YKU2011 [23]	†	No	No		†	No	No	
YIKU2012 [24]	No	†	No		No	†	No	
YIKU2015 [25]	†	†	No		†	†	No	No
NPL2012 [26]	†	†	No		†	†		
NPL2013 [27, 28]	No			No	No			?
NPL2015 [29]	†	No		No	†	No		No
CalLat2017 [30]	No	?		No	No	?		No

TABLE IV. A summary of sanity checks (i) consistency between $ERE_{k^2>0, BE}$ and $ERE_{k^2<0}$, (ii) non-singular ERE parameters and (iii) physical residue for the bound state pole, together with the source independence of ΔE . Here “No” means that the source independency/sanity check has failed, while the symbol † implies there is none or only insufficient study on the corresponding item. “Blank” implies that obvious contradiction is not found within the error bars, while it does not necessarily guarantee that the data are reliable. See appendix B for the meaning of the symbol ? on the Sanity check for NPL2013 and CalLat2017.

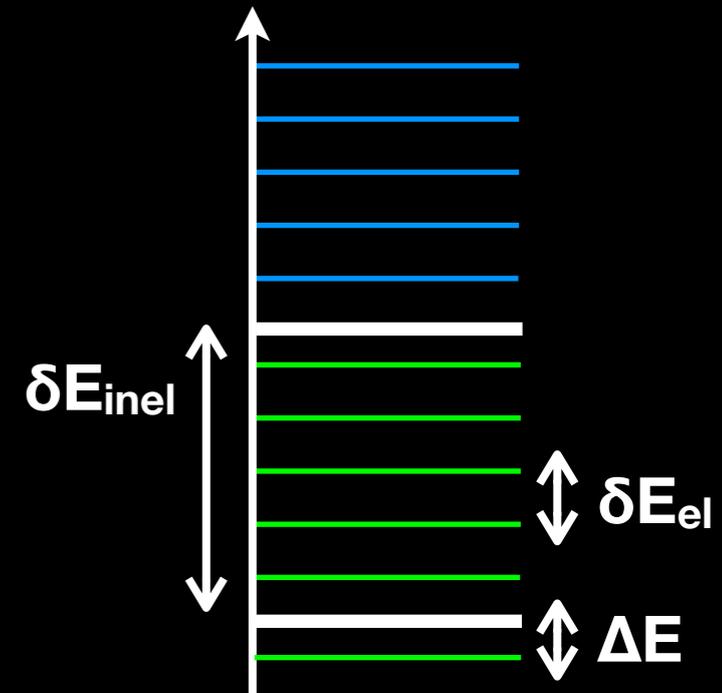

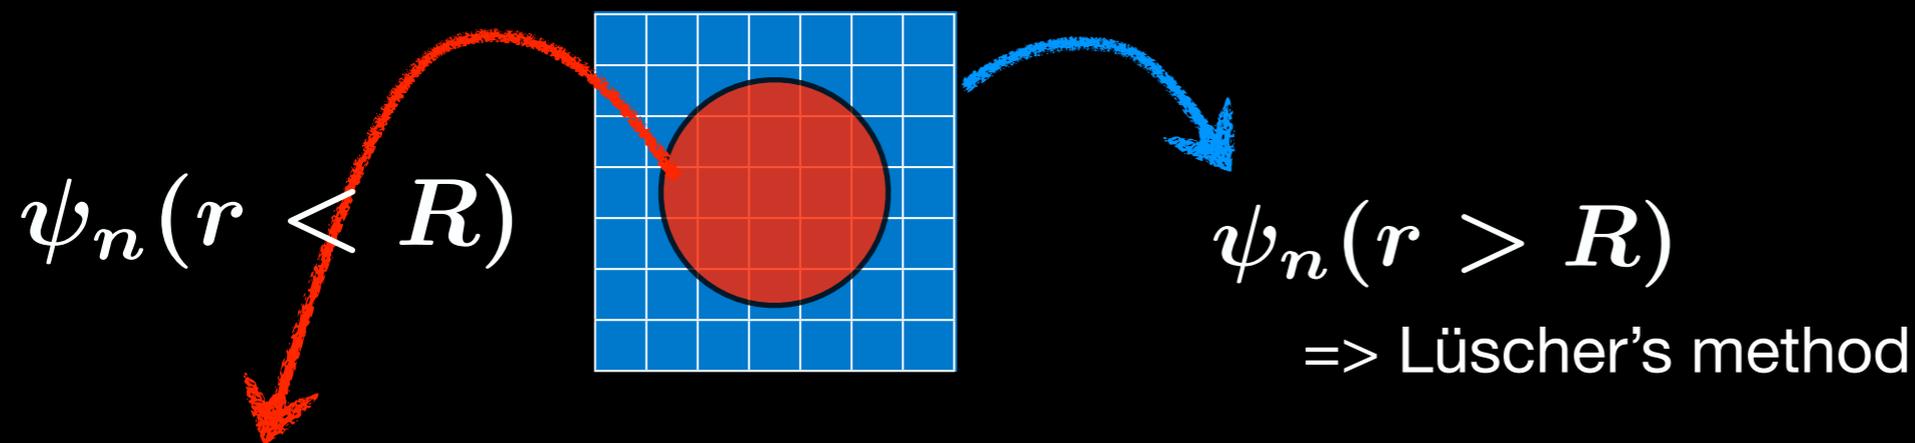

see talk by Aoki
(Thur.)

A solution: HAL QCD method -- potential as a representation of S-matrix --

- The scattering states do exist, and we cannot avoid contaminations
- We should tame the scattering states

Spacial correlation (NBS wave function)

$$\implies \psi_n(\vec{r}) \equiv \langle 0 | B_1(\vec{x}) B_2(\vec{y}) | W_n \rangle$$

• HAL QCD Method

▶ $\psi_n(r) \rightarrow$ **2PI kernel** ($\psi = \varphi + G_0 U \psi$) \rightarrow S-matrix

(phase shift, binding energy, ...)

Ishii, Aoki, Hatsuda, PRL 99, 022001 (2007).

Aoki, Hatsuda, Ishii, PTP123, 89 (2010).

Ishii et al. [HAL QCD], PLB 712, 437 (2012).

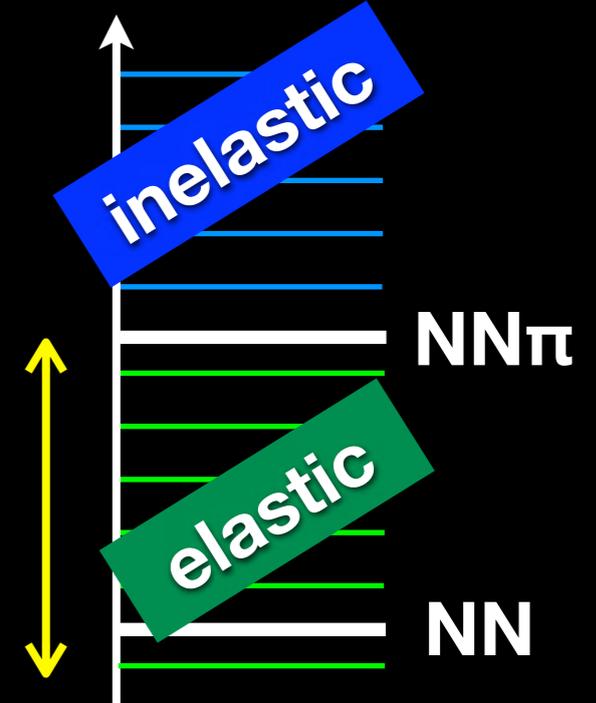

A solution: HAL QCD method -- potential as a representation of S-matrix --

✓ energy-independent potential $U(r,r')$

$$\int d\vec{r}' U(\vec{r}, \vec{r}') \psi_n(\vec{r}') = (E_n - H_0) \psi_n(\vec{r})$$

➔ All elastic states share the same potential $U(r,r')$

$$\begin{aligned} \int d\vec{r}' U(\vec{r}, \vec{r}') \psi_0(\vec{r}') &= (E_0 - H_0) \psi_0(\vec{r}) \\ \int d\vec{r}' U(\vec{r}, \vec{r}') \psi_1(\vec{r}') &= (E_1 - H_0) \psi_1(\vec{r}) \\ &\vdots \end{aligned}$$

✓ All equations are combined into time-dependent Schrödinger-type eq.

$$\int d\vec{r}' U(\vec{r}, \vec{r}') R(\vec{r}', t) = \left(-\frac{\partial}{\partial t} + \frac{1}{4m_B} \frac{\partial^2}{\partial t^2} - H_0 \right) R(\vec{r}, t)$$

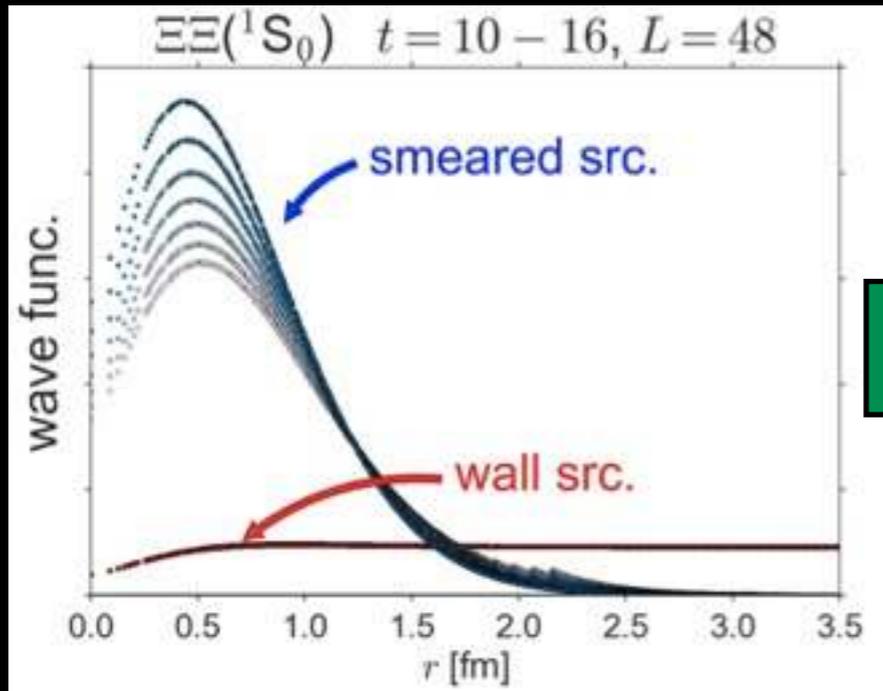

$$R(\vec{r}, t) = A_0 e^{-(W_0 - 2m_B)t} \psi_0(\vec{r}) + A_1 e^{-(W_1 - 2m_B)t} \psi_1(\vec{r}) + \dots$$

	Plateau method	HAL QCD method
Inelastic states	noise	noise
elastic states	noise	signal
necessary t (> t*)	t* ~ 10fm	t* ~ 1fm

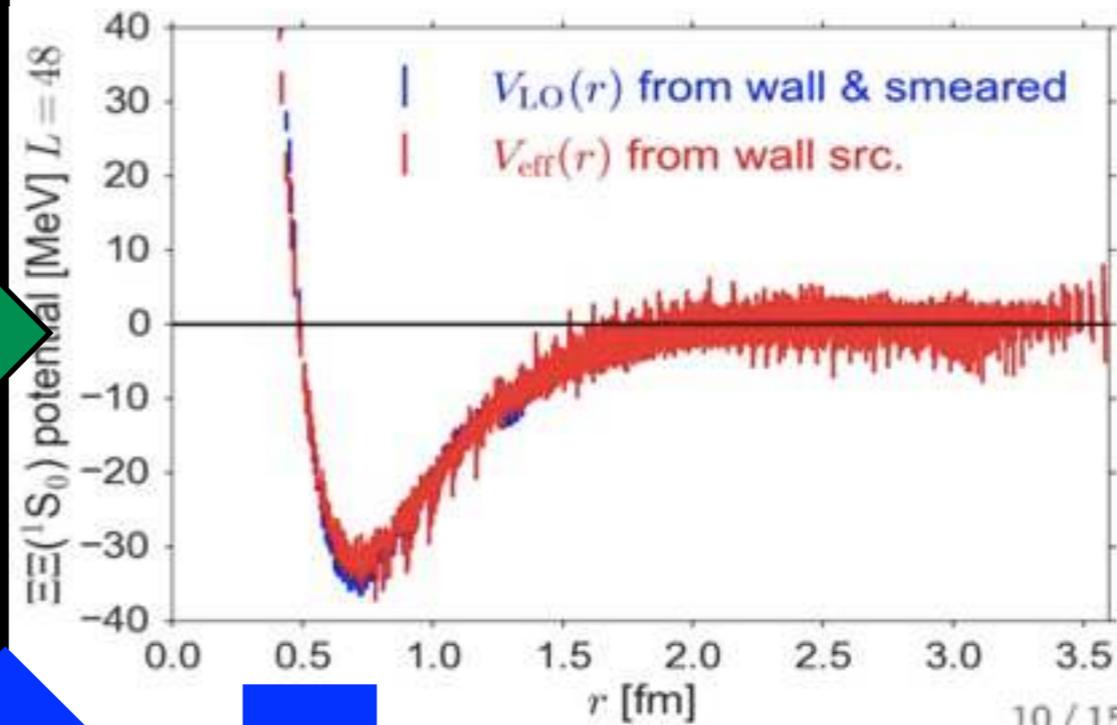

S/N improved exponentially

$\Xi\Xi$ (1S_0) in HAL QCD method @ $m_\pi=0.51\text{GeV}$, $L=4.3\text{fm}$, $a=0.09\text{fm}$

source dependence of $R(r,t)$

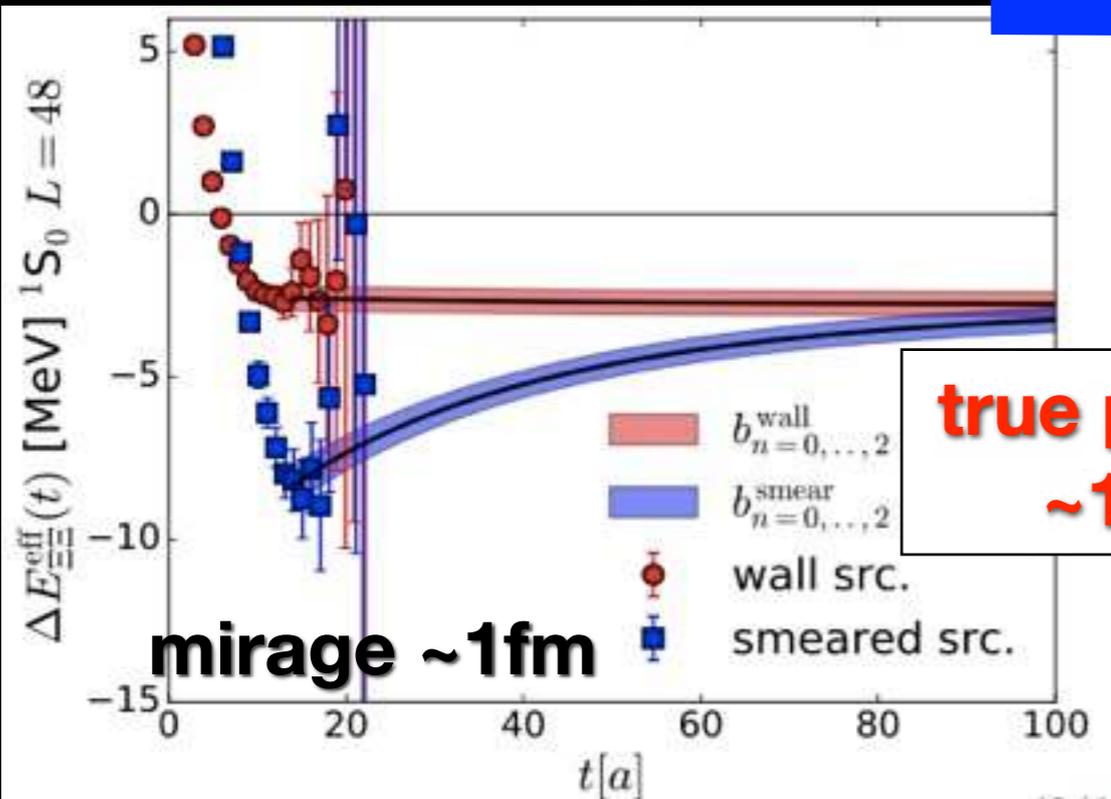

$$U(\vec{r}, \vec{r}') = [V_{\text{LO}}(\vec{r}) + V_{\text{NLO}}(\vec{r})\nabla^2 \dots] \delta(\vec{r} - \vec{r}')$$

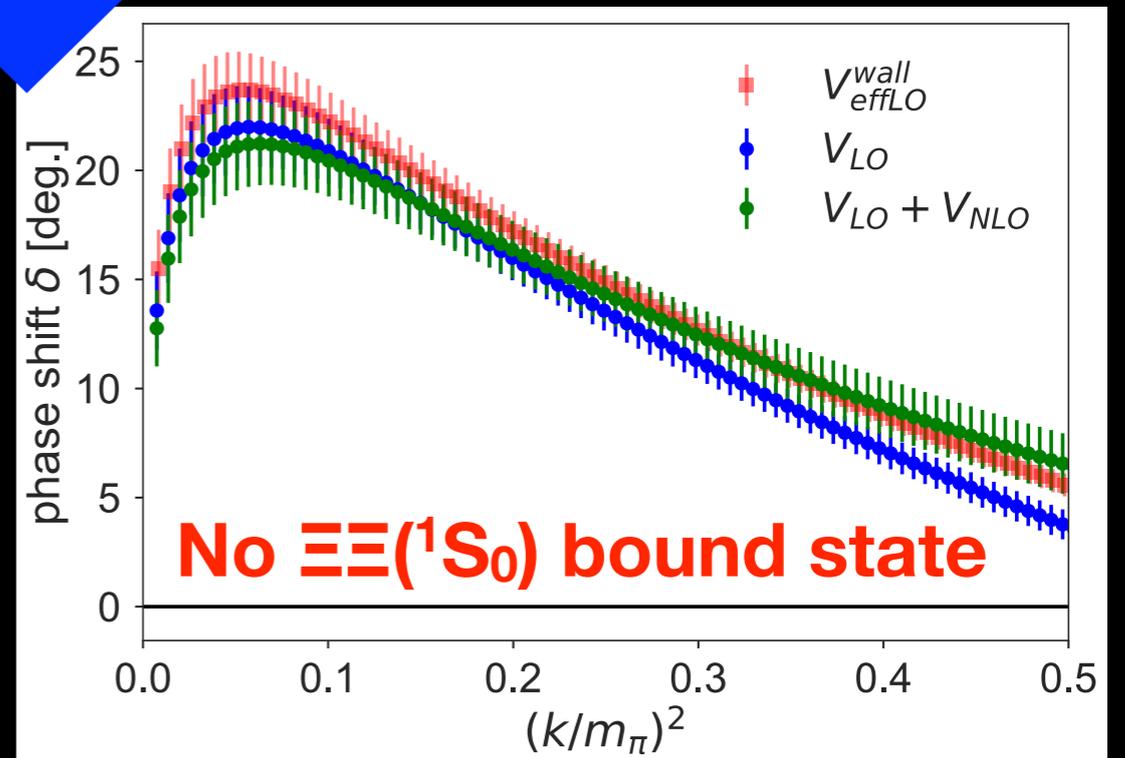

finite V calc.

→ Fate of fake plateaux

true plateau ~10fm

infinite V calc.

$D^{\text{bar}}D^*$ threshold effect

Chen et al.('14), Swanson('15)

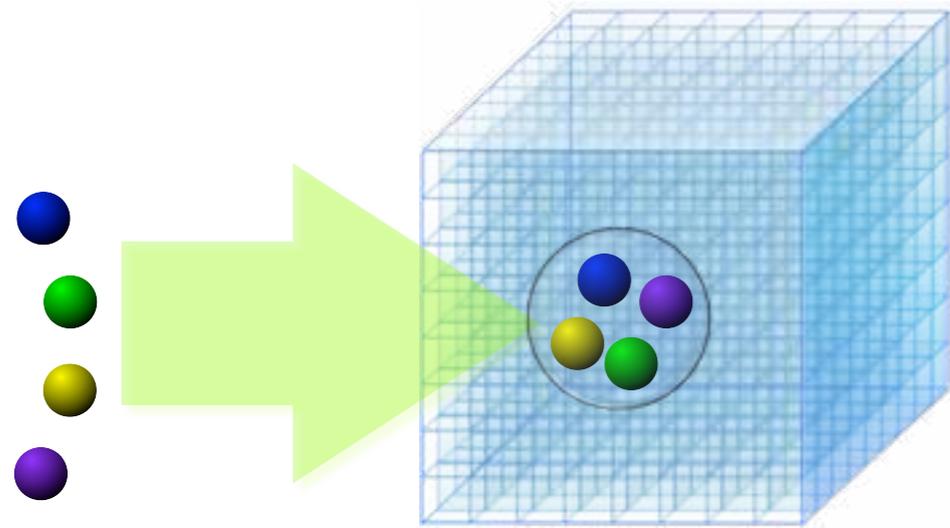

genuine state expected

kinematical origin

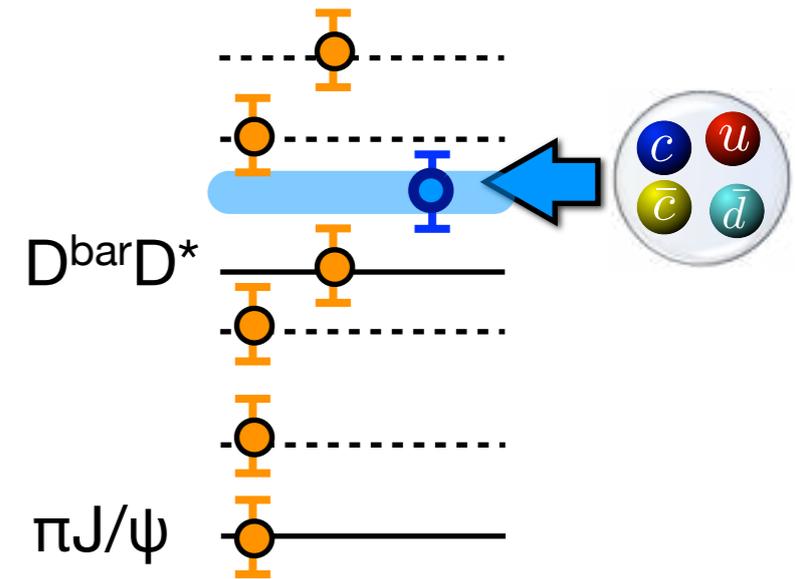

How to study $Z_c(3900)$ on the lattice?

◆ Conventional approach: temporal correlation

➔ identify all relevant $W_n(L)$ ($n=0,1,2,3,\dots$)

$$\langle 0 | \Phi [c\bar{c}u\bar{d}] (\tau) | W_n \rangle = e^{-W_n \tau}$$

✓ No positive evidence for $Z_c(3900)$ in $J^{PC} \equiv 1^{+-}$

variational method

S. Prelovsek et al., PLB 727 (2013), PRD91 (2015).

S.-H. Lee et al., PoS Lattice2014 (2014).

see also $D^{\text{bar}}D^*$ single channel calc. Y. Chen et al., PRD89 (2014).

★ Why is the peak observed in expt.?

▶ resonance? threshold effect?

➔ resonance search in manifest coupled-channel necessary

(To understand expt. signals for exotics from QCD is very challenging)

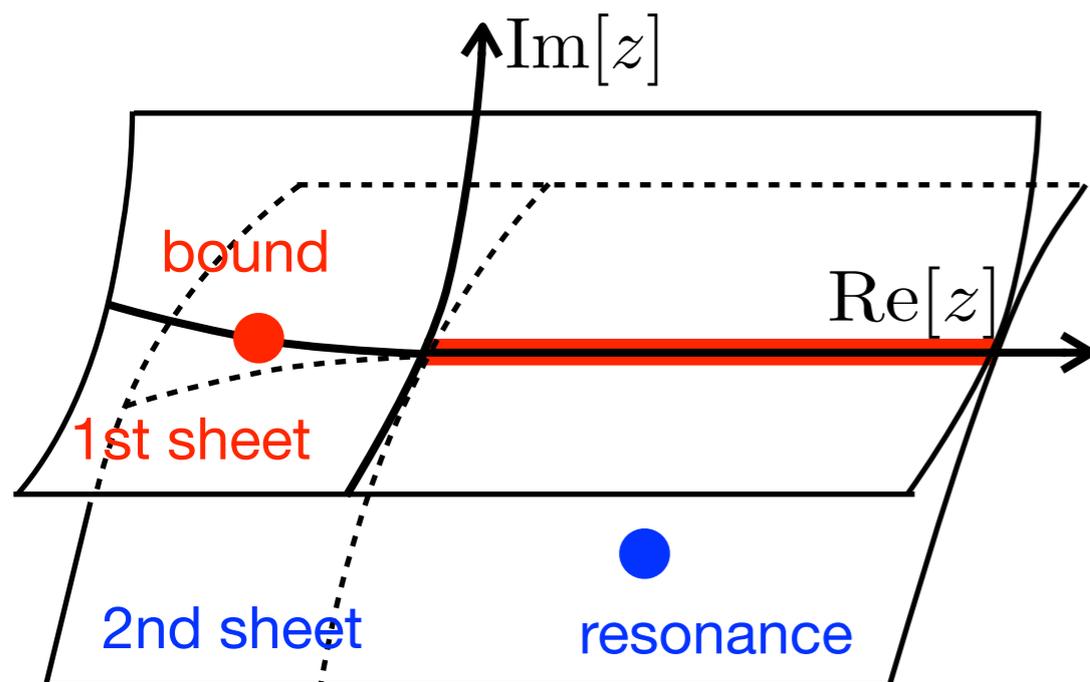

How to search for resonances **on the lattice**

★ Resonance energy is NOT eigen-energy W_n $\langle 0 | \Phi[c\bar{c}u\bar{d}](\tau) | W_n \rangle = e^{-W_n \tau}$

$S(W)$ ← S-matrix from HAL QCD method

► NBS wave func. $\psi(r)$ --> "potential" --> infinite V calc. --> $S(W)$

Analyticity of S-matrix is **uniquely** determined (S-matrix theory)

bound state (1st sheet)

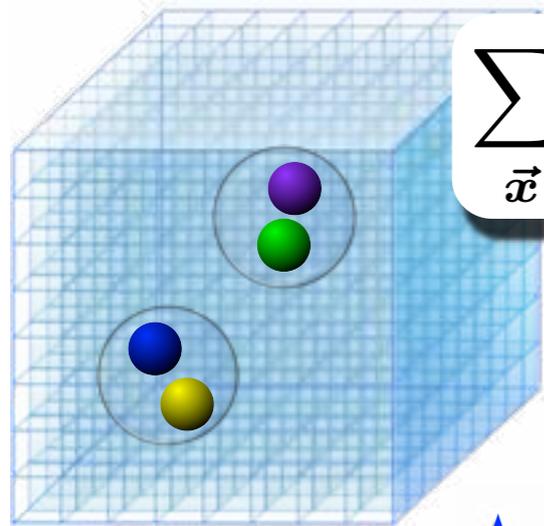

- pole position --> binding energy
- residue --> coupling to scattering state

resonance (2nd sheet)

- analytic continuation onto 2nd sheet
- pole position --> resonance energy
- residue --> coupling to scat. state, partial decay

Coupled-channel HAL QCD method

◆ measure not only temporal but also **spatial** correlation

$$\sum_{\vec{x}} \langle 0 | \phi_1^a(\vec{x} + \vec{r}, t) \phi_2^a(\vec{x}, t) \mathcal{J}^\dagger(0) | 0 \rangle = \sqrt{Z_1^a Z_2^a} \sum_n A_n \psi_n^a(\vec{r}) e^{-W_n t}$$

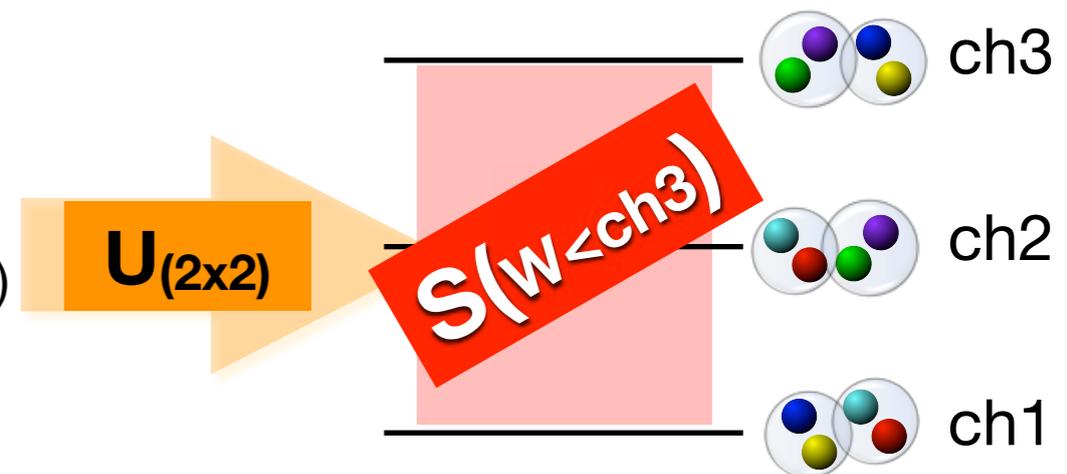

Ishii, Aoki, Hatsuda, PRL99, 02201 (2007).
 Aoki, Hatsuda, Ishii, PTP123, 89 (2010).
 Ishii et al. (HAL QCD), PLB712, 437(2012).

★ spatial correlation --> identify **channel** wave function

$$\left(\nabla^2 + (\vec{k}_n^a)^2 \right) \psi_n^a(\vec{r}) = 2\mu^a \sum_b \int d\vec{r}' U^{ab}(\vec{r}, \vec{r}') \psi_n^b(\vec{r}')$$

★ **coupled-channel potential** $U^{ab}(r, r')$:

- $U^{ab}(r, r')$ is faithful to **coupled-channel S-matrix**
- $U^{ab}(r, r')$ is **energy independent** (until new threshold opens)
- Non-relativistic approximation is not necessary
- $U^{ab}(r, r')$ contains all 2PI contributions

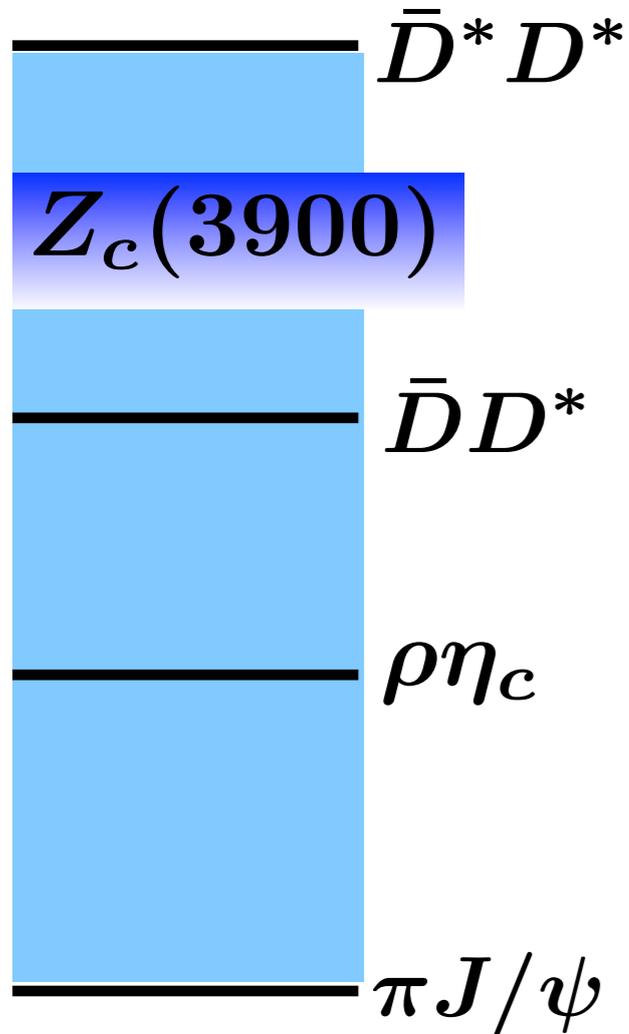

➡ **derive potential from time-dependent HAL QCD method**

$Z_c(3900)$ in $1^G(J^{PC})=1^+(1^{+-})$

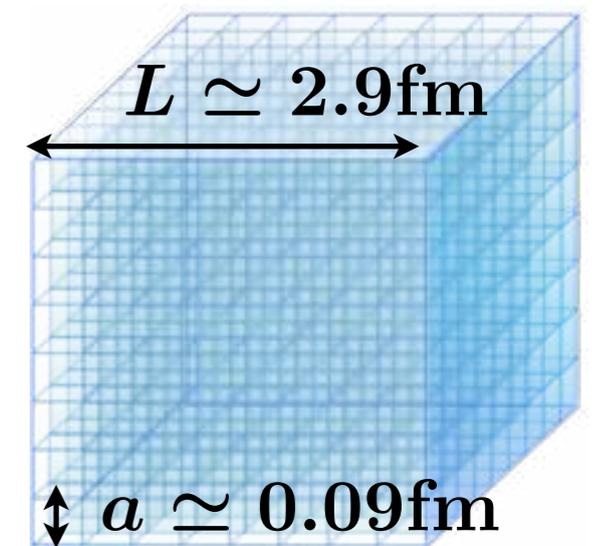

-- $\pi J/\psi$ - $\rho\eta_c$ - $D^{\text{bar}}D^*$ coupled-channel --

[Y. Ikeda et al., \[HAL QCD\], PRL117, 242001 \(2016\).](#)

❖ $N_f=2+1$ full QCD

- Iwasaki gauge

- $32^3 \times 64$ lattice

❖ Tsukuba-type Relativistic Heavy Quark (charm)

- remove leading cutoff errors $O((m_c a)^n)$, $O(\Lambda_{\text{QCD}} a)$, ...
- ➔ We are left with $O((a\Lambda_{\text{QCD}})^2)$ syst. error (\sim a few %)

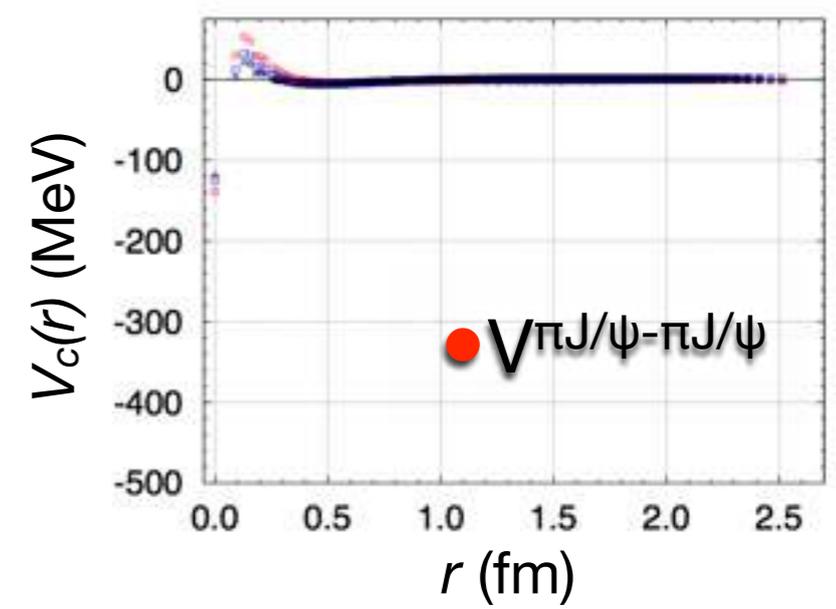

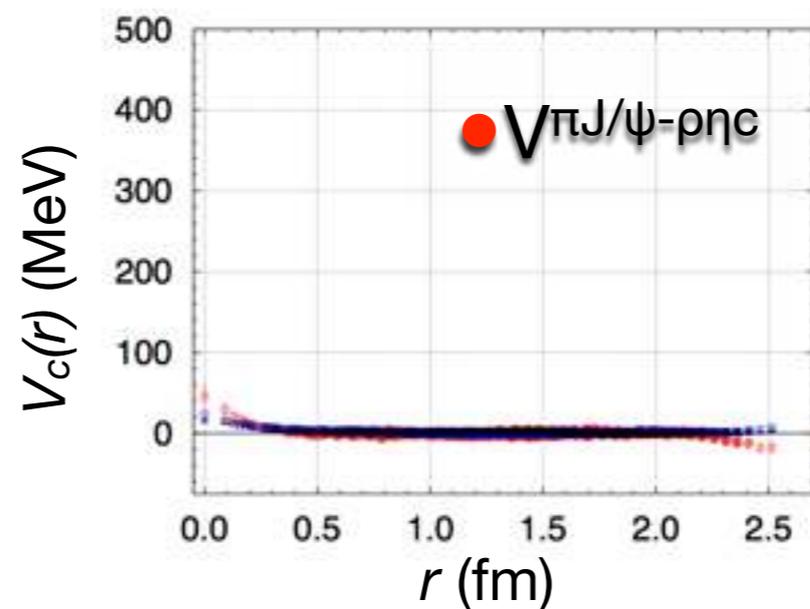

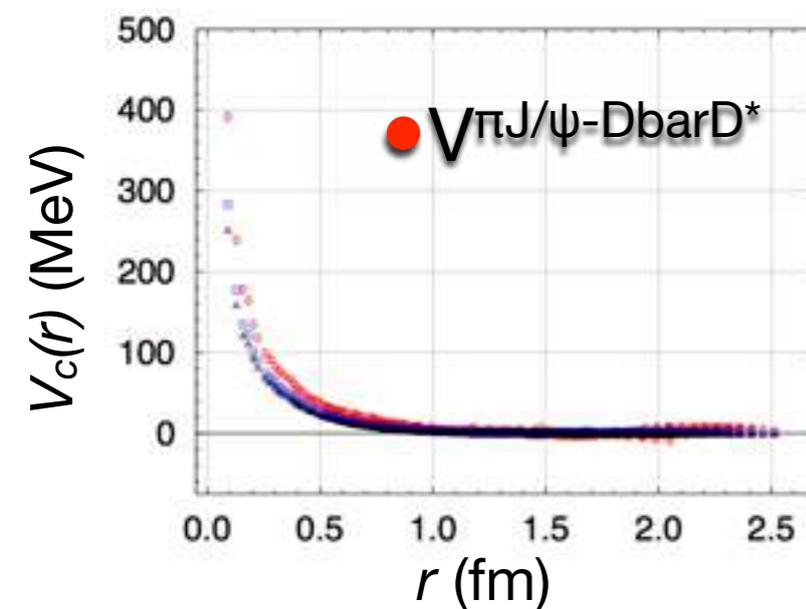

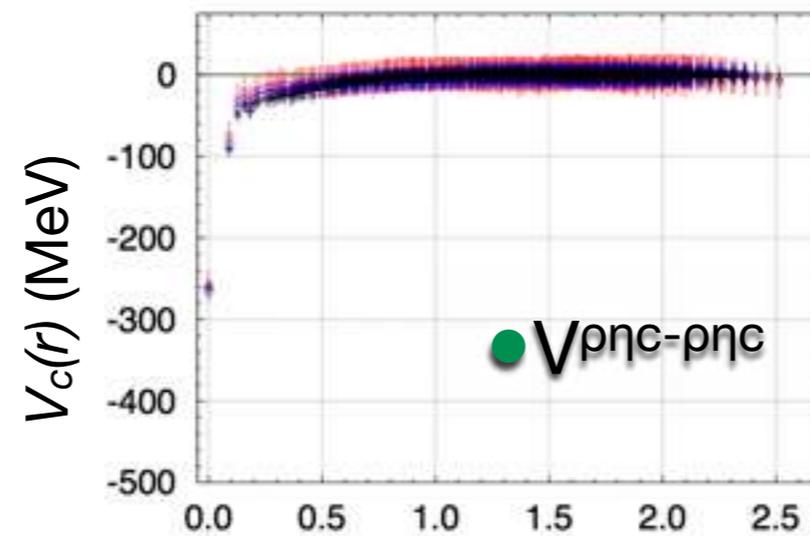

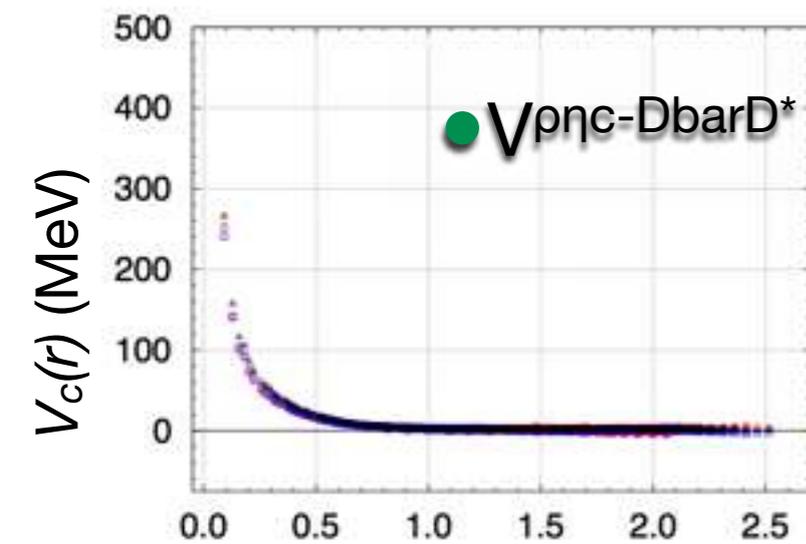

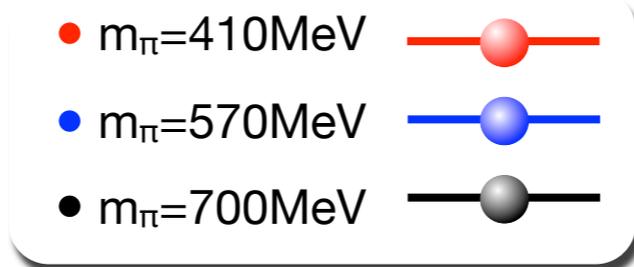

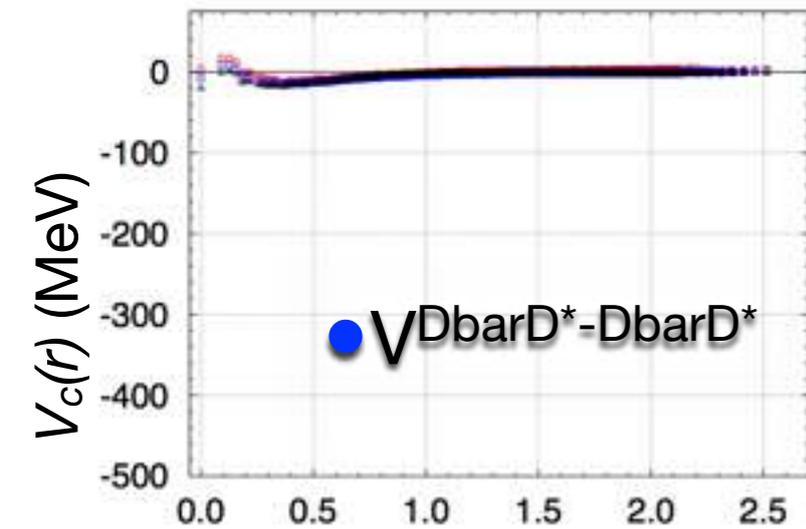

light meson mass (MeV)

$m_\pi = 411(1), 572(1), 701(1)$
 $m_\rho = 896(8), 1000(5), 1097(4)$

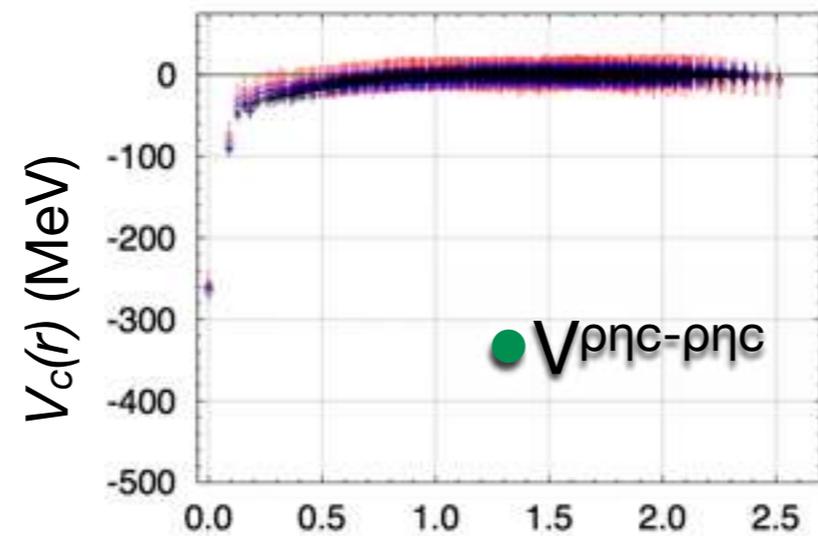

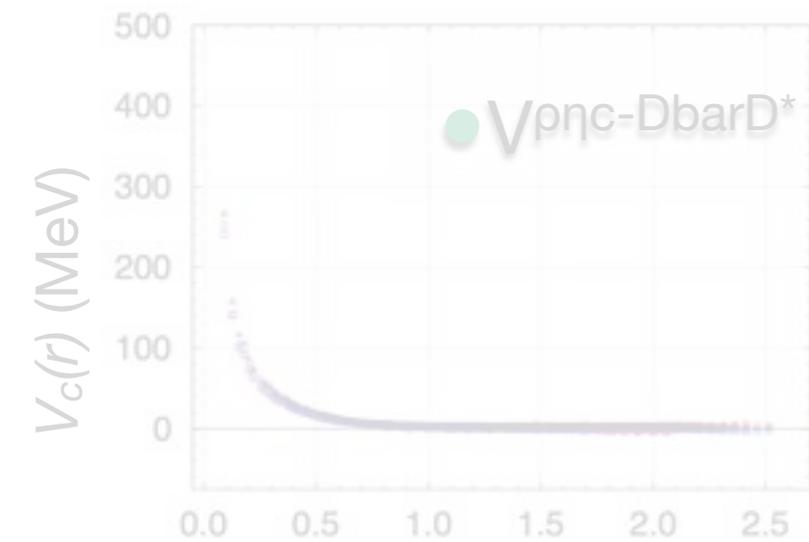

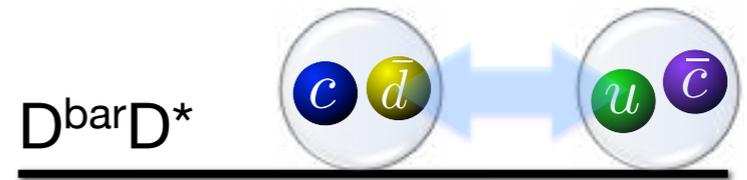

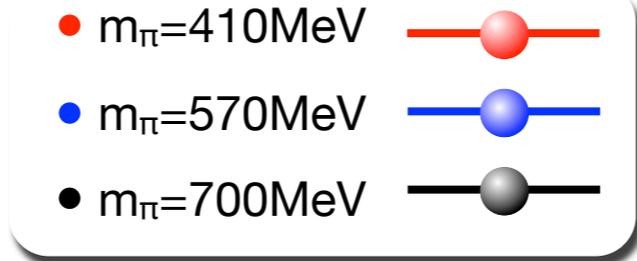

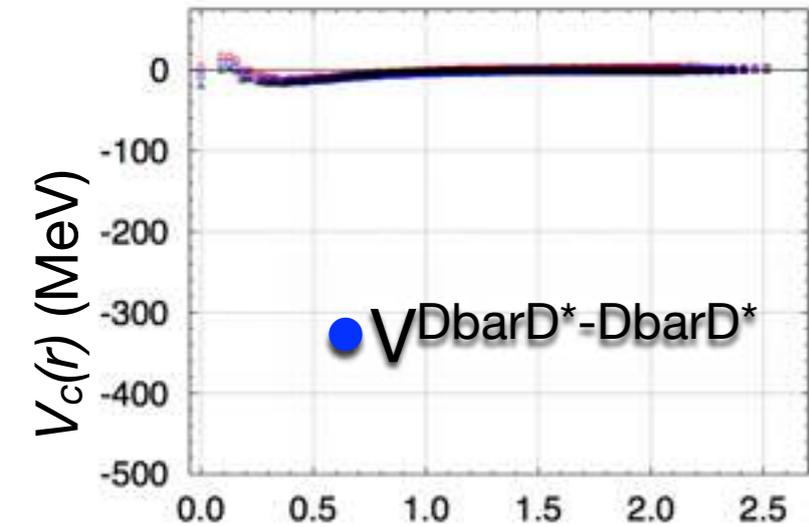

charm meson mass (MeV)

$m_{\eta_c} = 2988(1), 3005(1), 3024(1)$
 $m_{J/\psi} = 3097(1), 3118(1), 3143(1)$
 $m_D = 1903(1), 1947(1), 2000(1)$
 $m_{D^*} = 2056(3), 2101(2), 2159(2)$

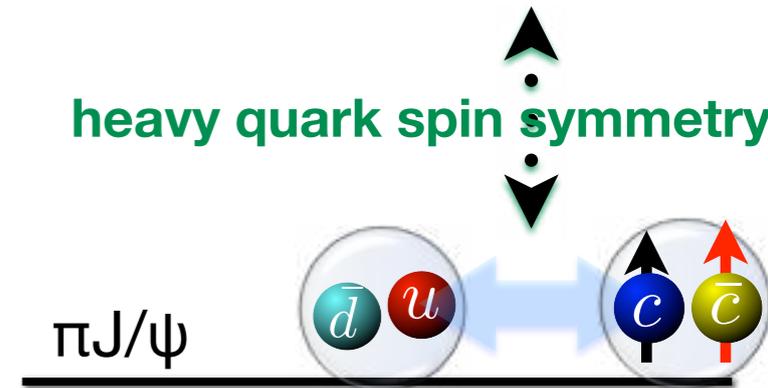

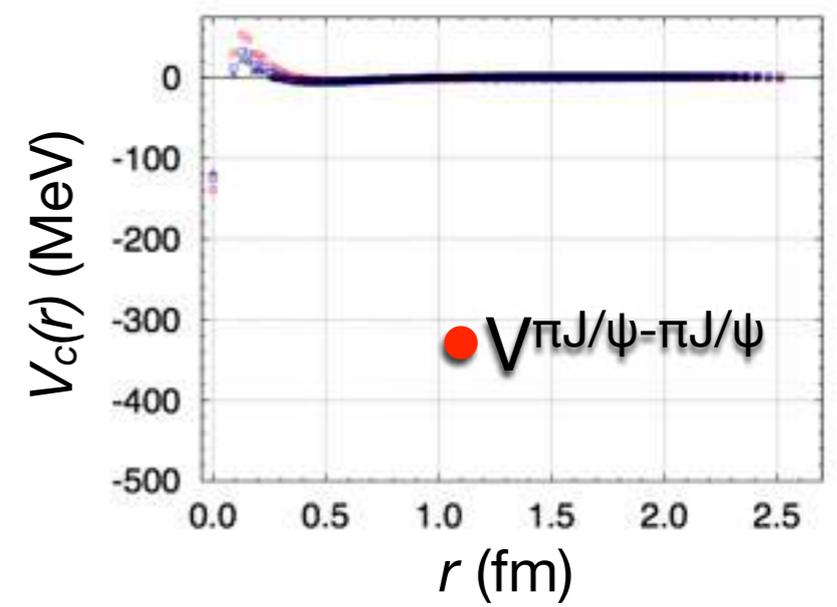

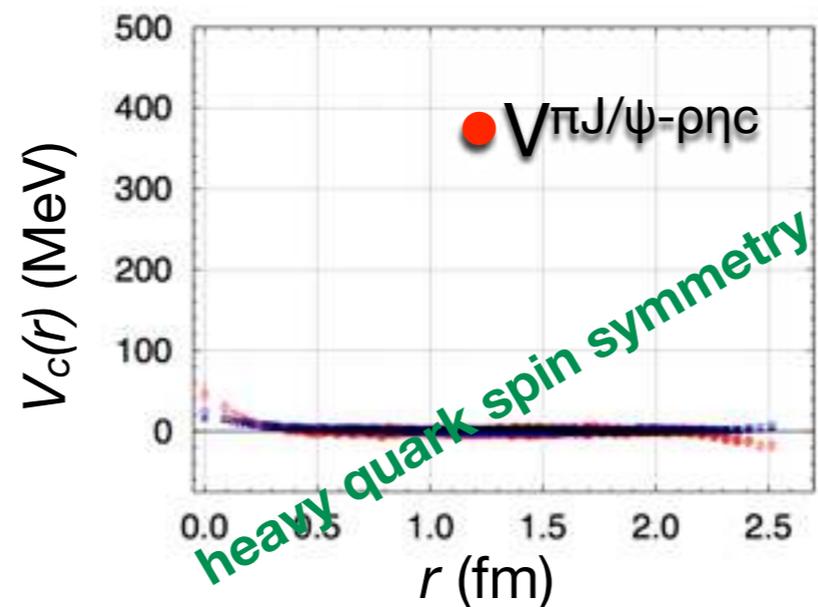

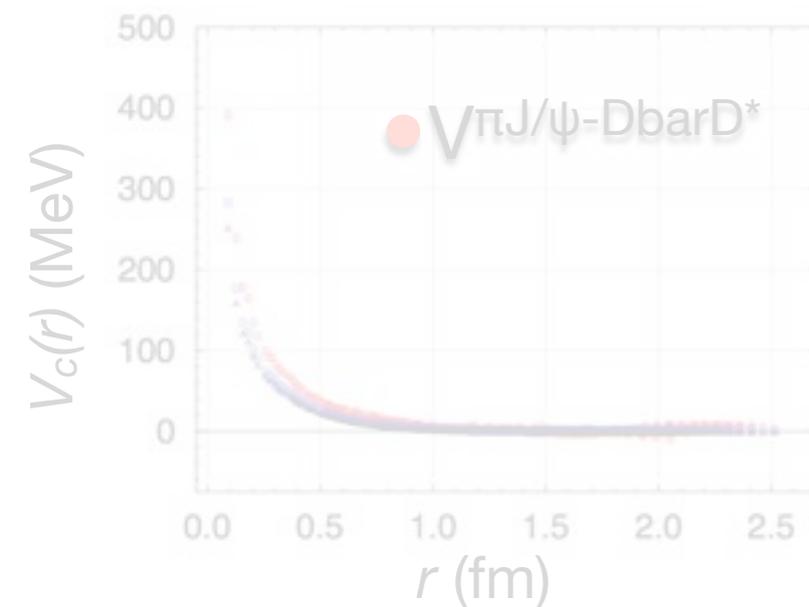

3x3 potential matrix ($\pi J/\psi$ - $\rho\eta_c$ - $D^{\text{bar}}D^*$)

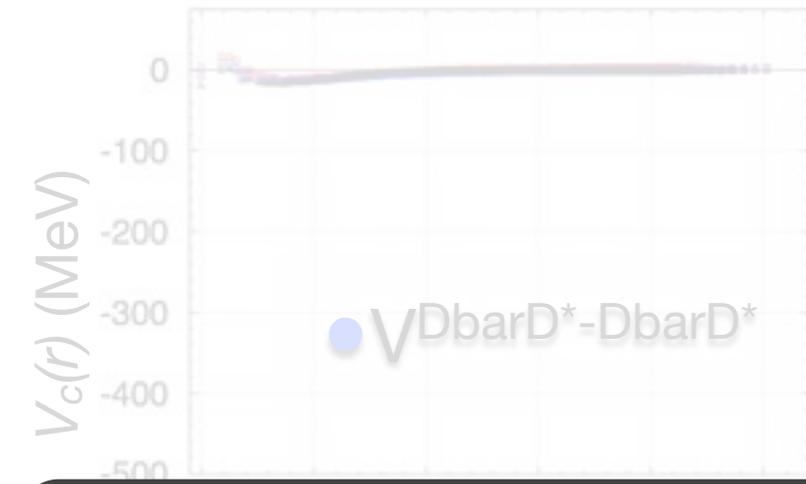

3x3 potential matrix ($\pi J/\psi$ - $\rho\eta_c$ - $D^{\text{bar}}D^*$)

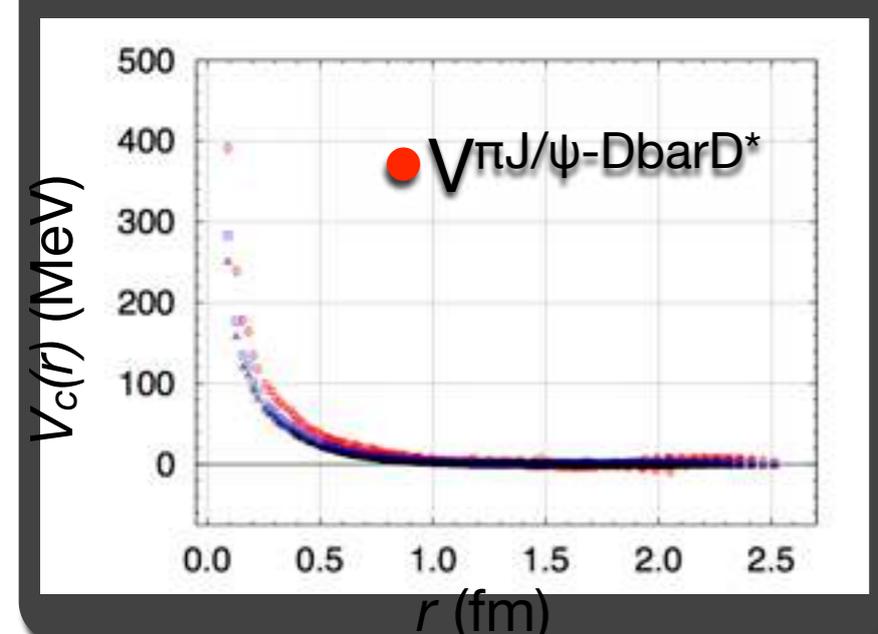

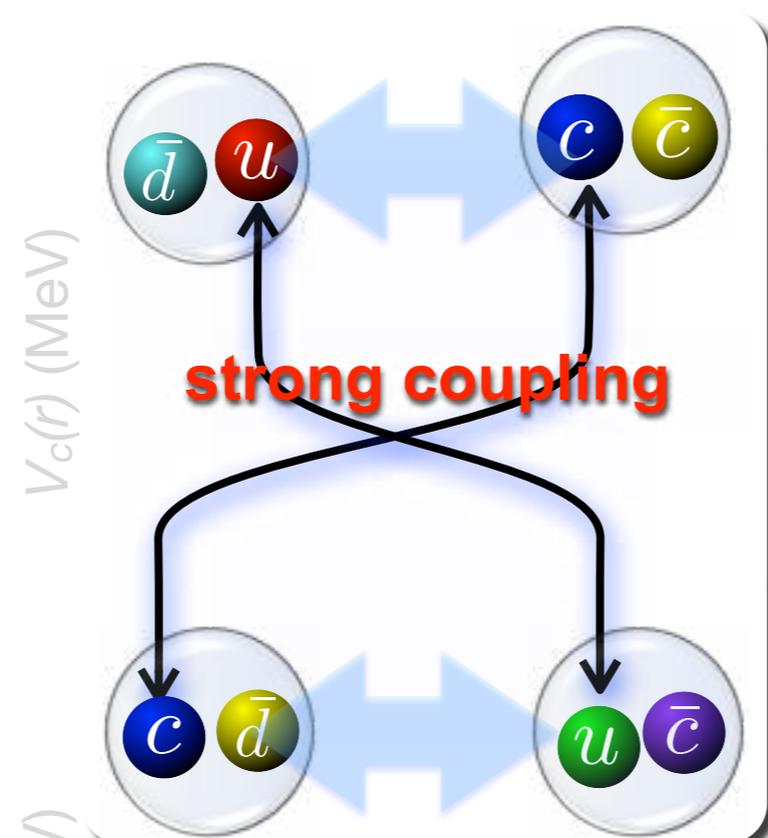

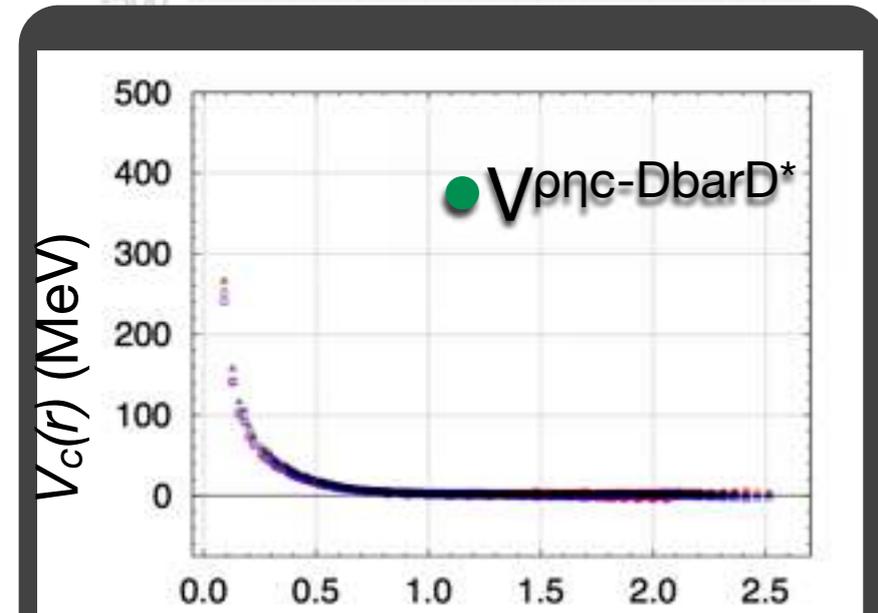

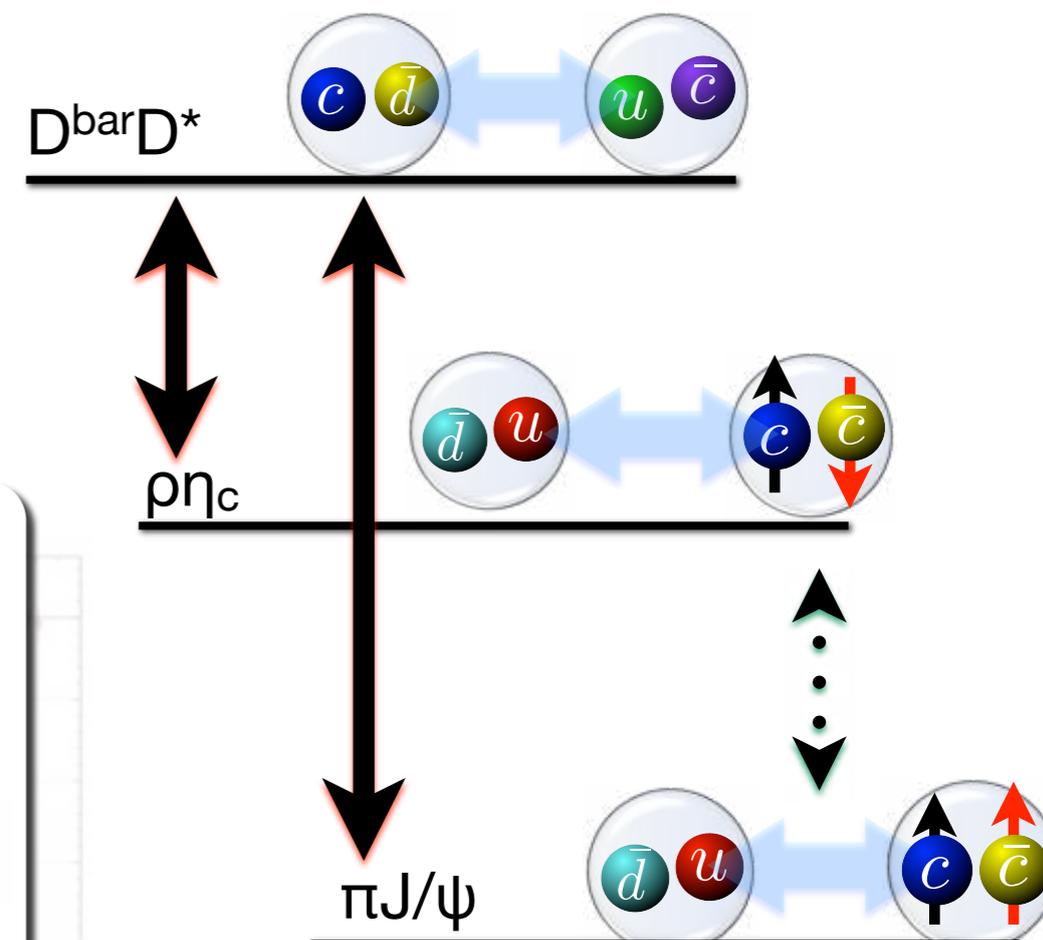

heavy quark spin symmetry

3x3 potential matrix ($\pi J/\psi$ - $\rho\eta_c$ - $D^{\text{bar}}D^*$)

- $m_\pi = 410 \text{ MeV}$ (red line)
- $m_\pi = 570 \text{ MeV}$ (blue line)
- $m_\pi = 700 \text{ MeV}$ (black line)

- strong $V_{\pi J/\psi, D^{\text{bar}}D^*}$ & $V_{\rho\eta_c, D^{\text{bar}}D^*}$
- ➡ charm quark exchange process

Structure of $Z_c(3900)$

studied by **the most ideal scattering process**

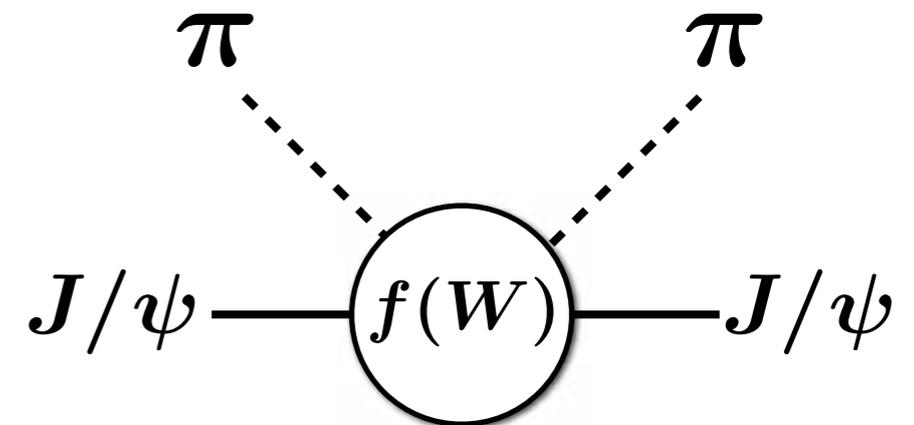

- **S-wave $\pi J/\psi$ - $\rho\eta_c$ - $D^{\text{bar}}D^*$ coupled-channel scattering**

➔ $Z_c(3900)$ is observed in $\pi J/\psi$ --> 2-body scattering is the most ideal reaction

1. invariant mass distribution of 2-body scattering

of scat. particles proportional to imaginary part of amplitude

$$N_{\text{sc}} \propto (\text{flux}) \cdot \sigma(W) \propto \text{Im}f(W)$$

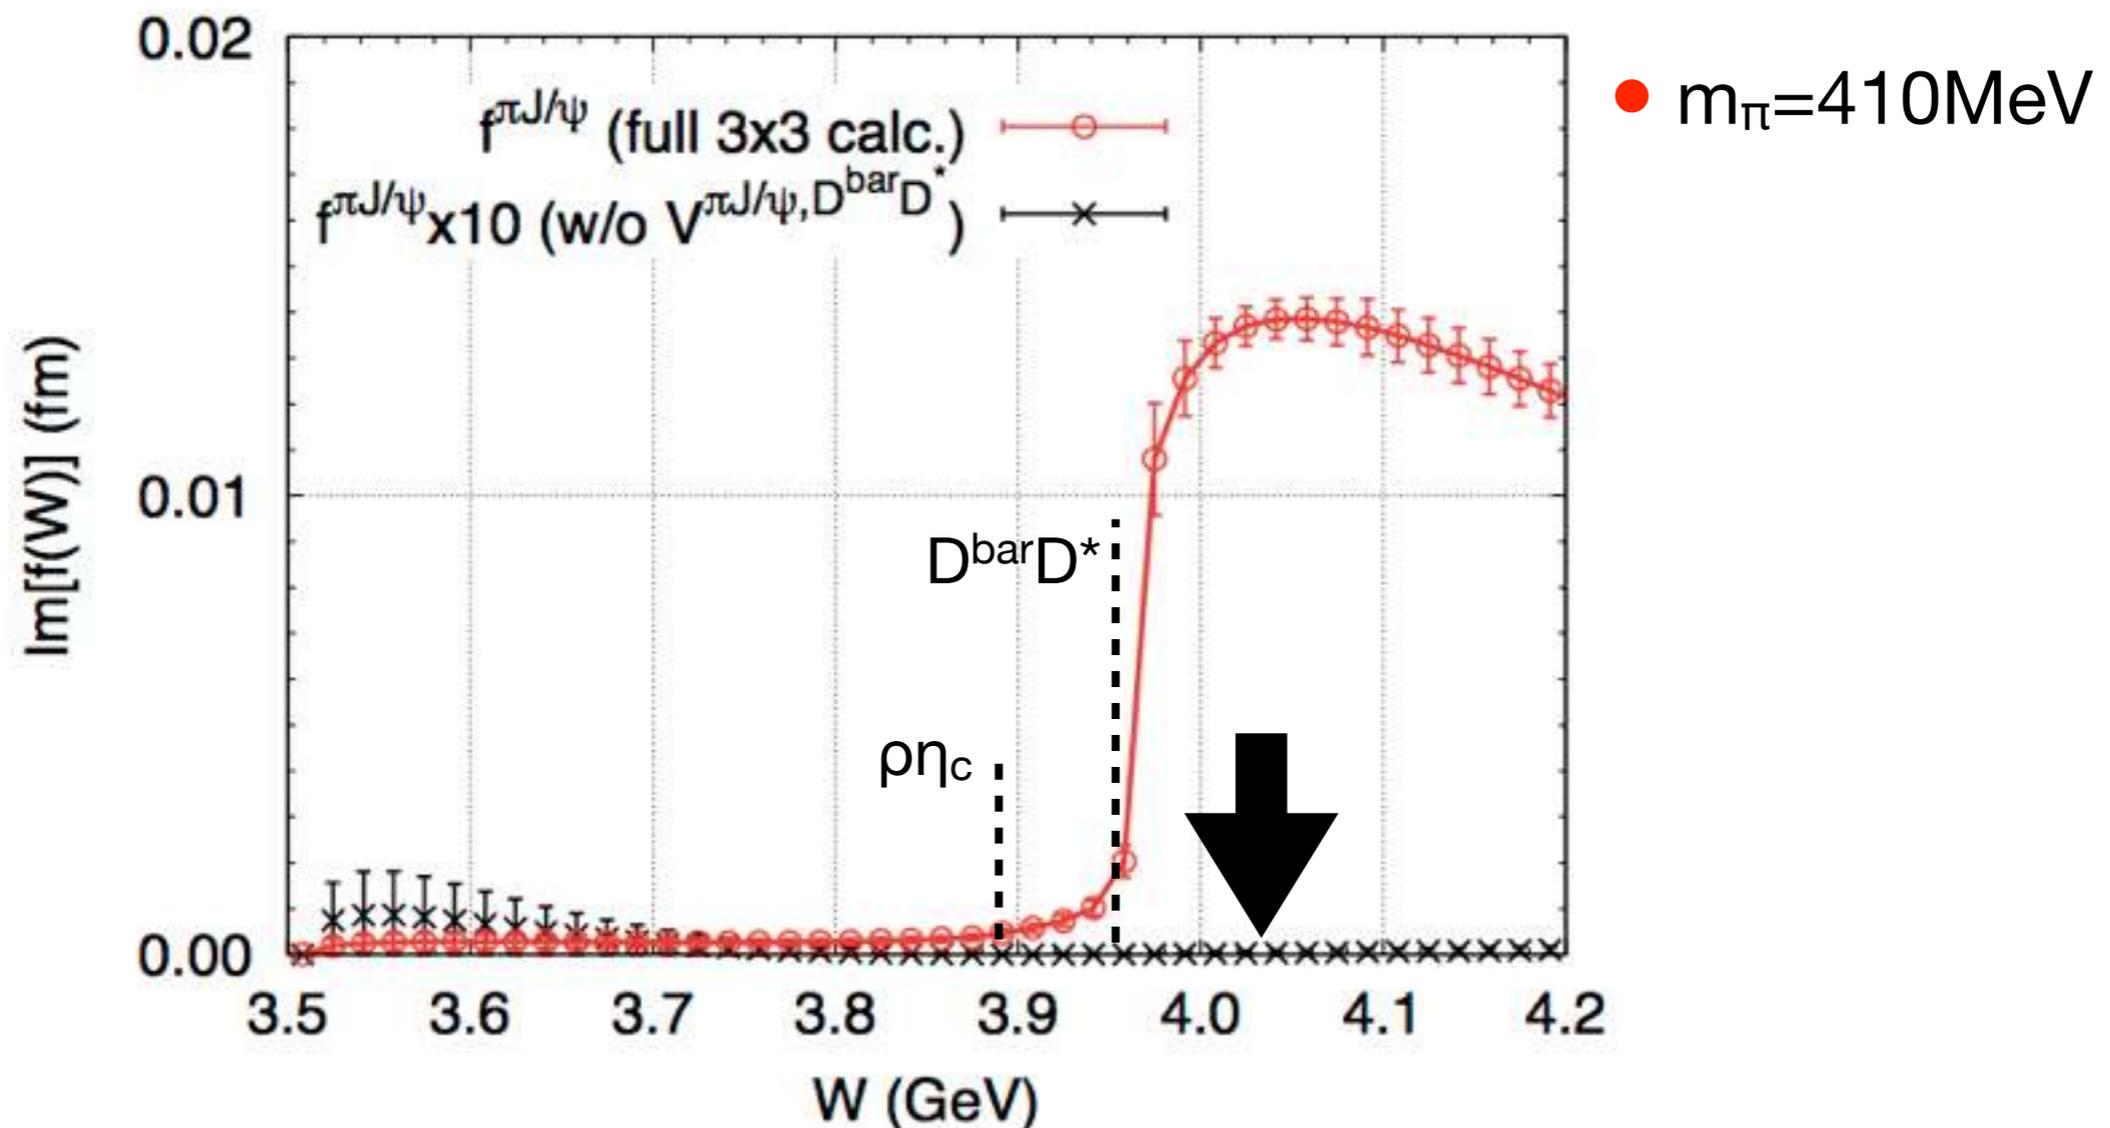

2. pole position of S-matrix

- ▶ analytic continuation of c.c. S-matrix onto complex energy plane
- ▶ understand nature of $Z_c(3900)$

- Results w/ $m_\pi=410\text{MeV}$ are shown. (**weak quark mass dependence observed**)

Invariant mass of $\pi J/\psi$ 2-body scattering

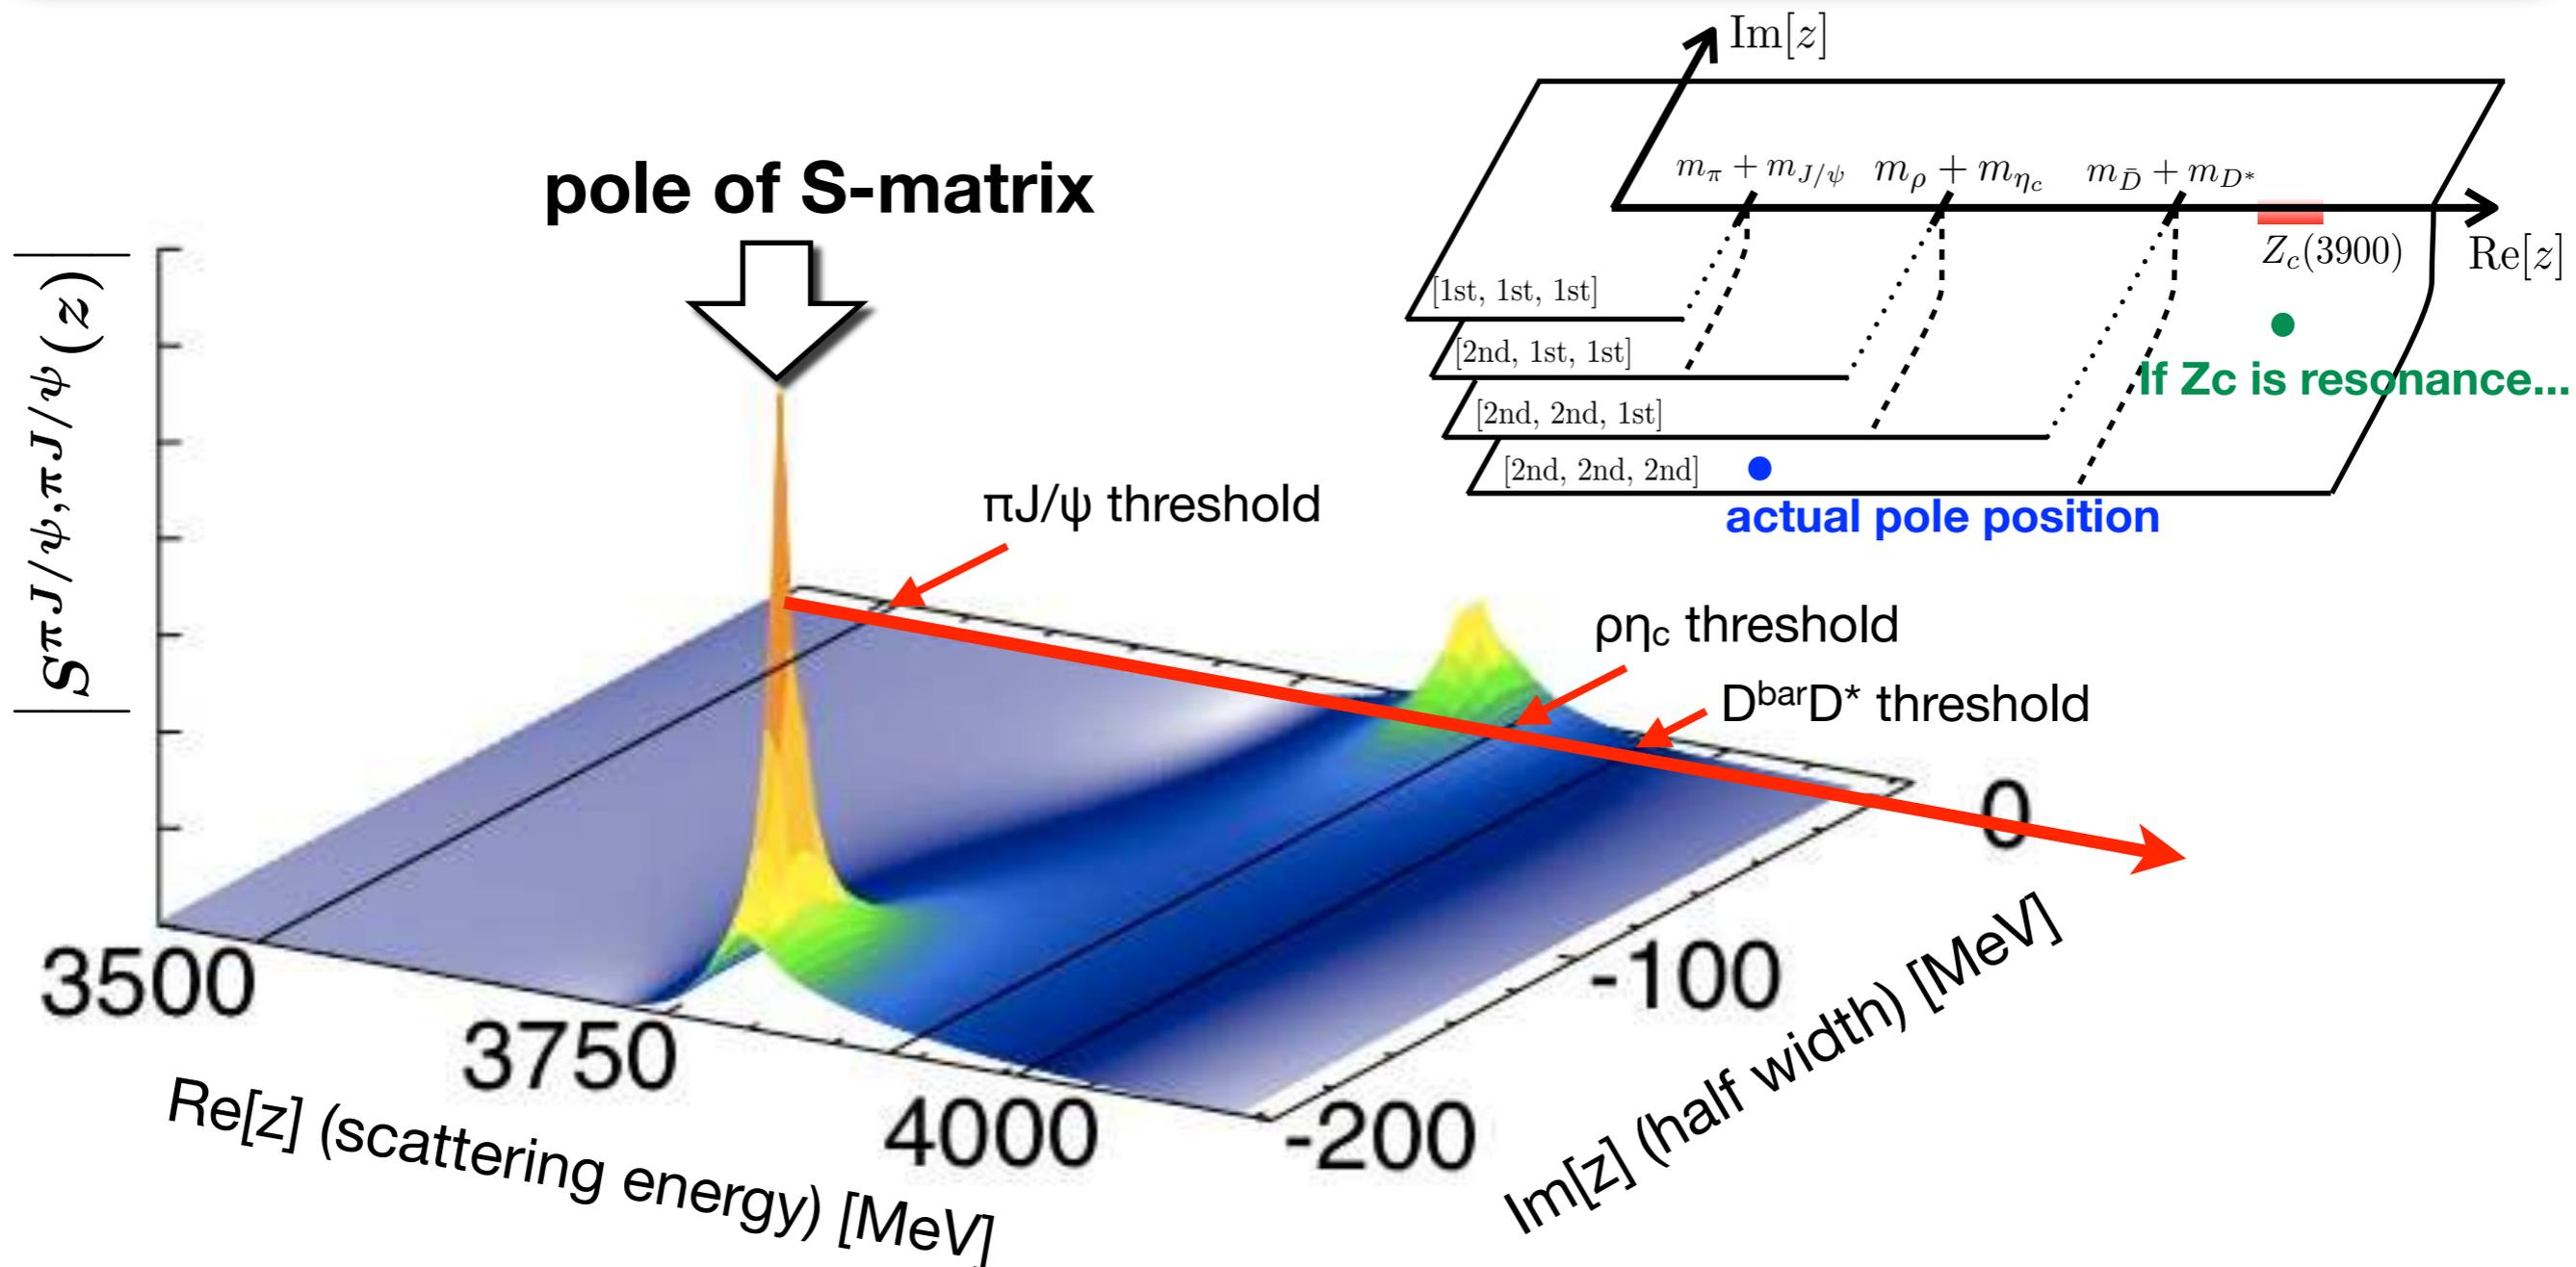

✓ Enhancement just above $D^{\text{bar}} D^*$ threshold

➔ effect of strong $V^{\pi J/\psi, D^{\text{bar}} D^*}$ (black $\rightarrow V^{\pi J/\psi, D^{\text{bar}} D^*}=0$)

● line shape not Breit-Wigner

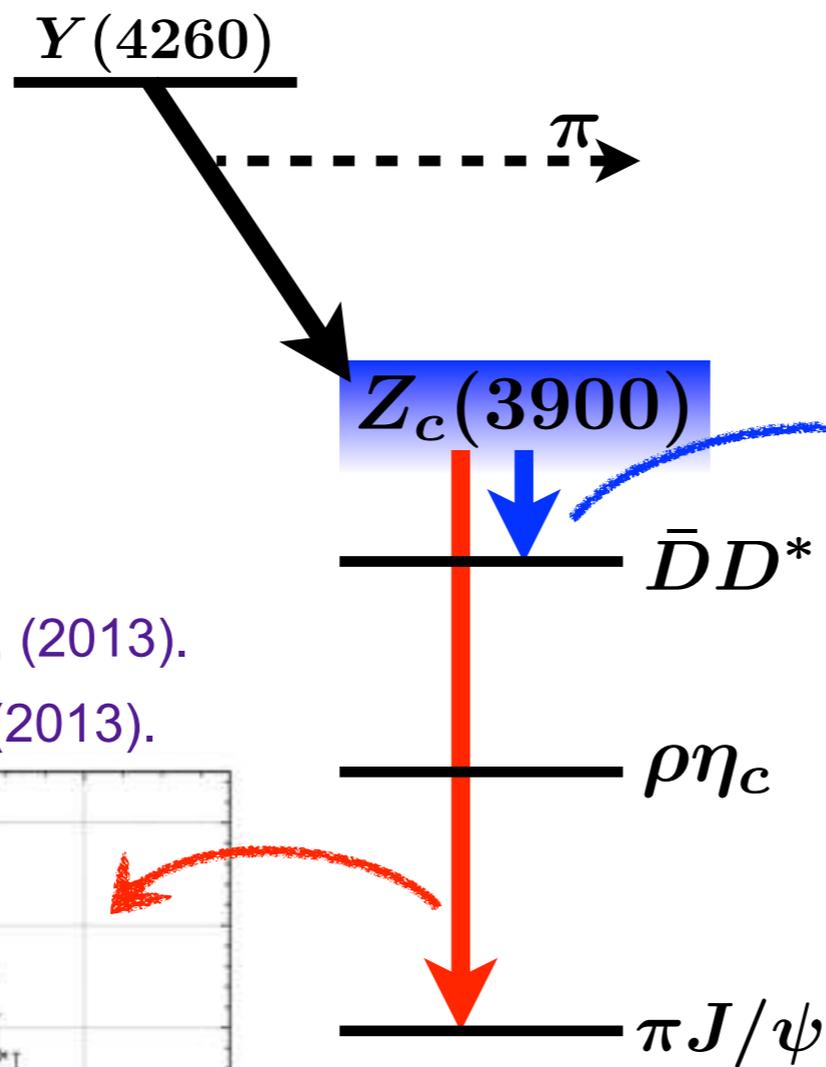

✓ Is $Z_c(3900)$ a conventional resonance? \rightarrow pole of S-matrix

Pole of S-matrix ($\pi J/\psi$:2nd, $\rho\eta_c$:2nd, $D^{\text{bar}}D^*$:2nd)

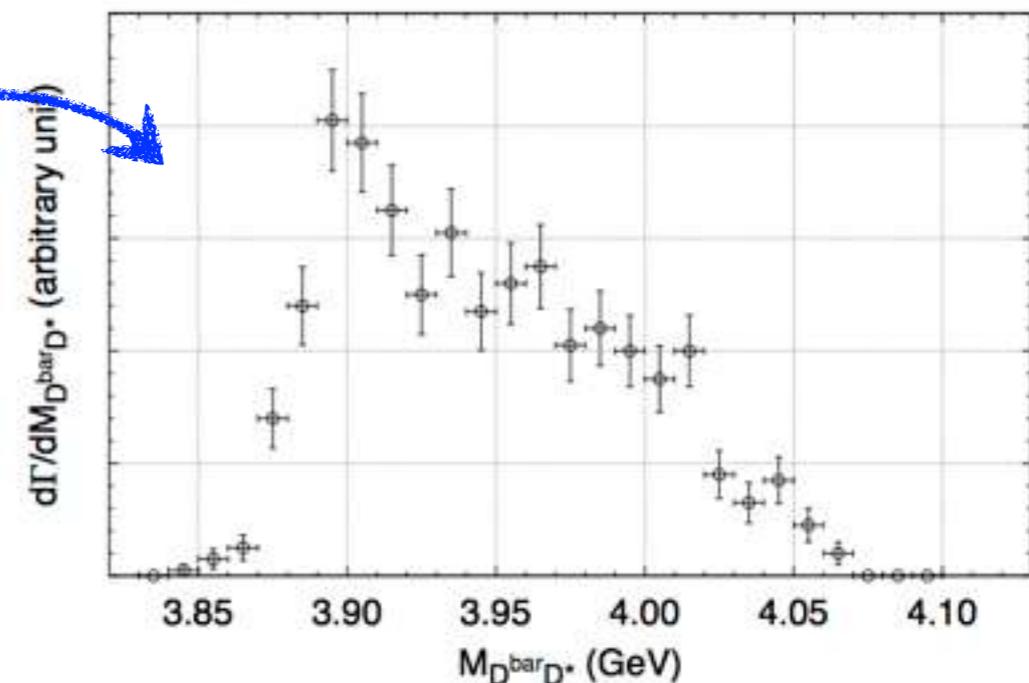

- Pole corresponding to “**virtual state**”
- Pole contribution to scat. observables is small (far from scat. axis)
- $Z_c(3900)$ is not a resonance but “**threshold cusp**” induced by strong $V^{\pi J/\psi, D^{\text{bar}}D^*}$

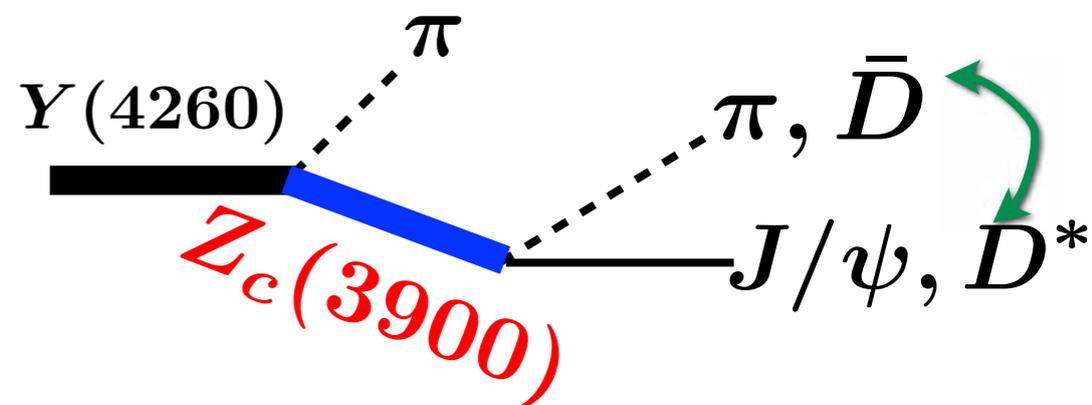

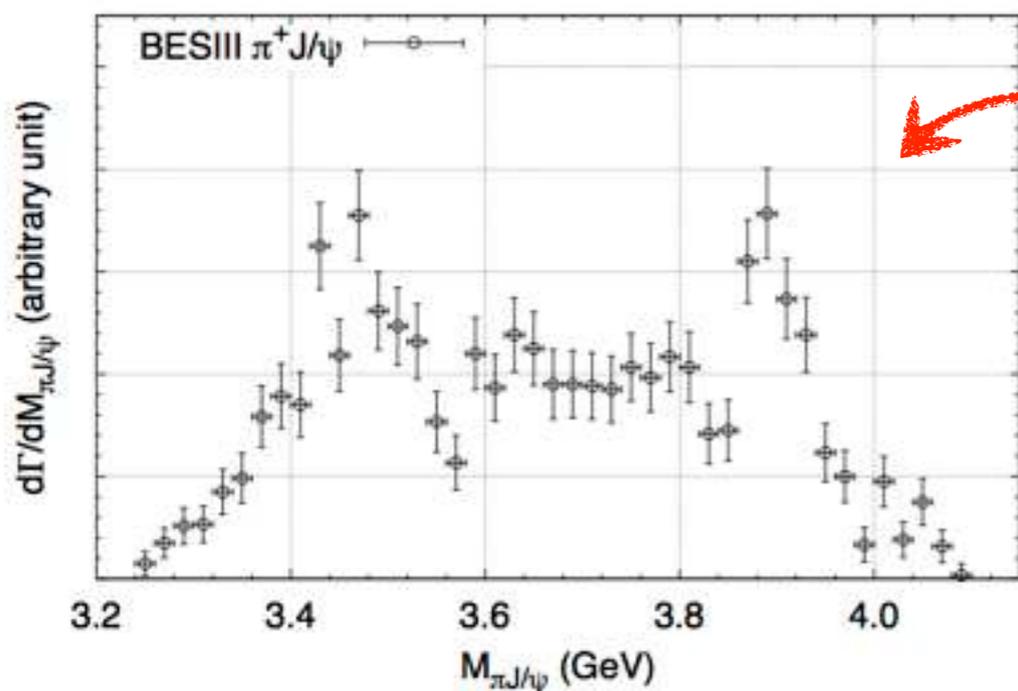

Comparison with expt. data: -- spectrum of $Y(4260)$ 3-body decay --

BESIII Coll., PRL112, 022001, (2014).
Wang (BESIII Coll.), MENU2016 talk

BESIII Coll., PRL110, 252001, (2013).
Belle Coll., PRL110, 252002, (2013).

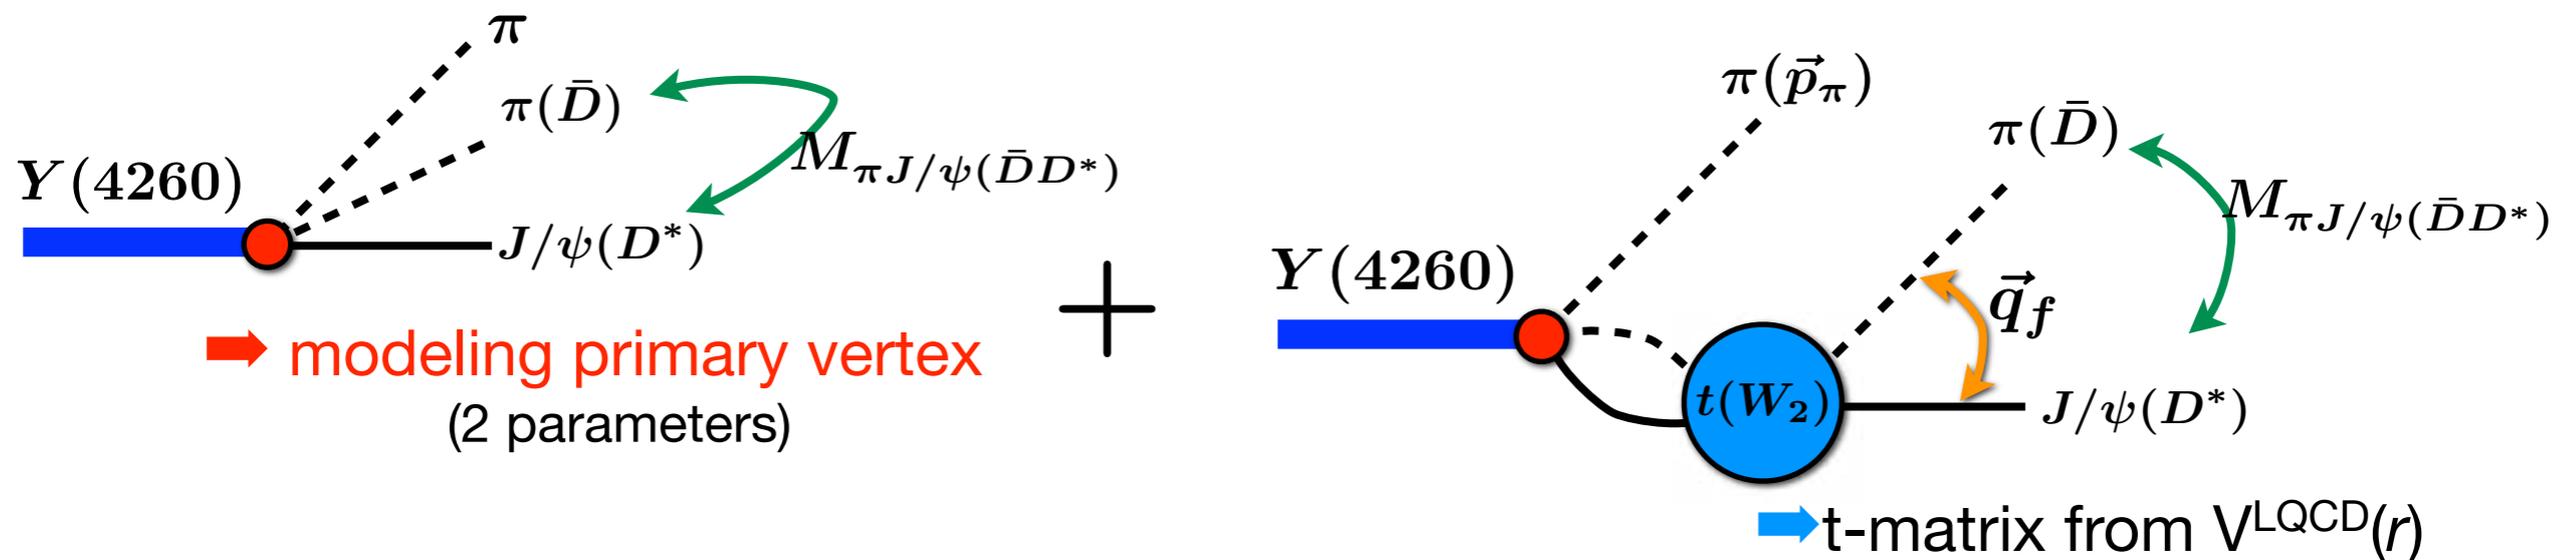

$Y(4260) \rightarrow \pi\pi J/\psi$ & $\pi D^{\text{bar}} D^*$

$$d\Gamma_{Y \rightarrow \pi+f} = (2\pi)^4 \delta(W_3 - E_\pi(\vec{p}_\pi) - E_f(\vec{q}_f)) d^3 p_\pi d^3 q_f |T_{Y \rightarrow \pi+f}(\vec{p}_\pi, \vec{q}_f; W_3)|^2$$

✓ 3-body T-matrix: $T_{Y \rightarrow \pi+f}(W_3=4260\text{MeV})$

$$T_{Y \rightarrow \pi+f}(\vec{p}_\pi, \vec{q}_f; W_3) = \sum_{n=\pi J/\psi, \bar{D} D^*} C^{Y \rightarrow \pi+n} \left[\delta_{nf} + \int d^3 q' \frac{t_{nf}(\vec{q}', \vec{q}_f, \vec{p}_\pi; W_3)}{W_3 - E_\pi(\vec{p}_\pi) - E_n(\vec{q}', \vec{p}_\pi) + i\epsilon} \right]$$

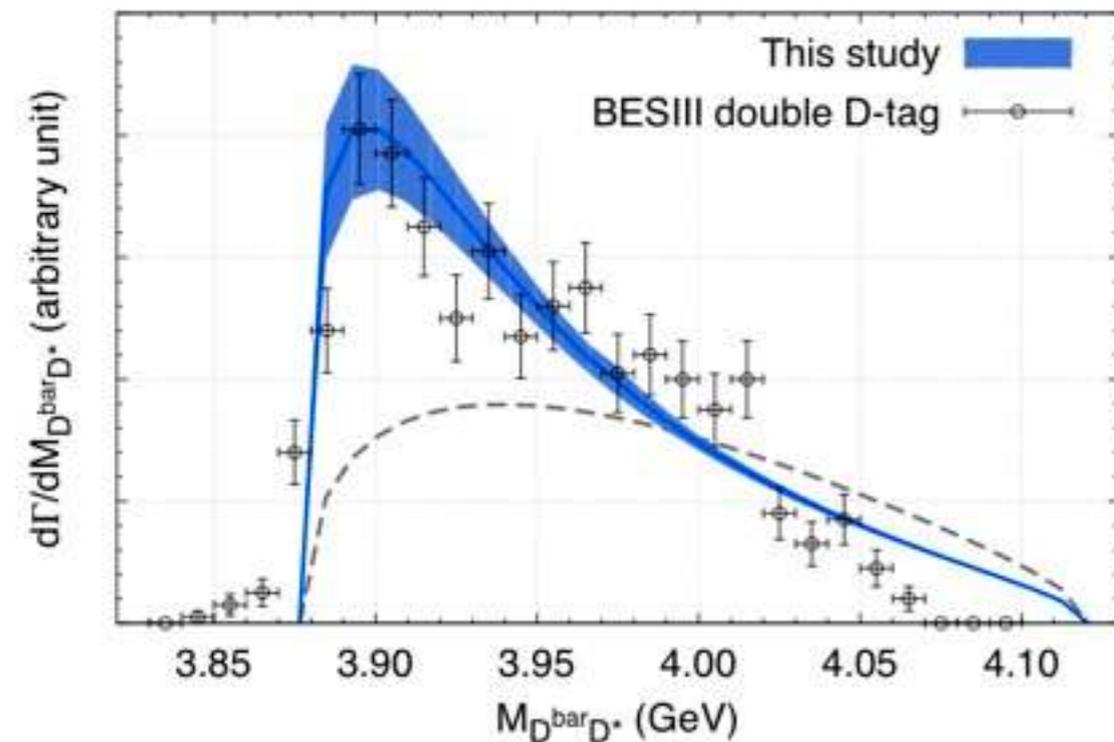

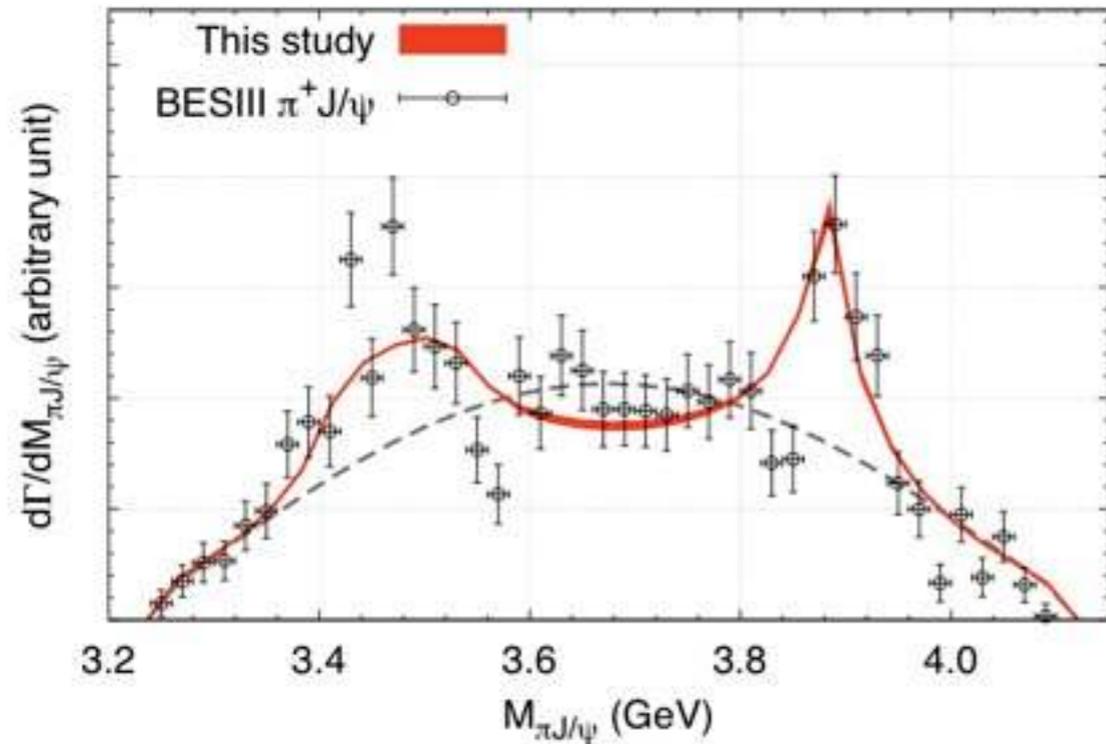

employ physical hadron masses to compare w/ expt. data

✓ $V^{\text{LQCD}}(r)$ is taken into account --> calculate t-matrix for subsystem

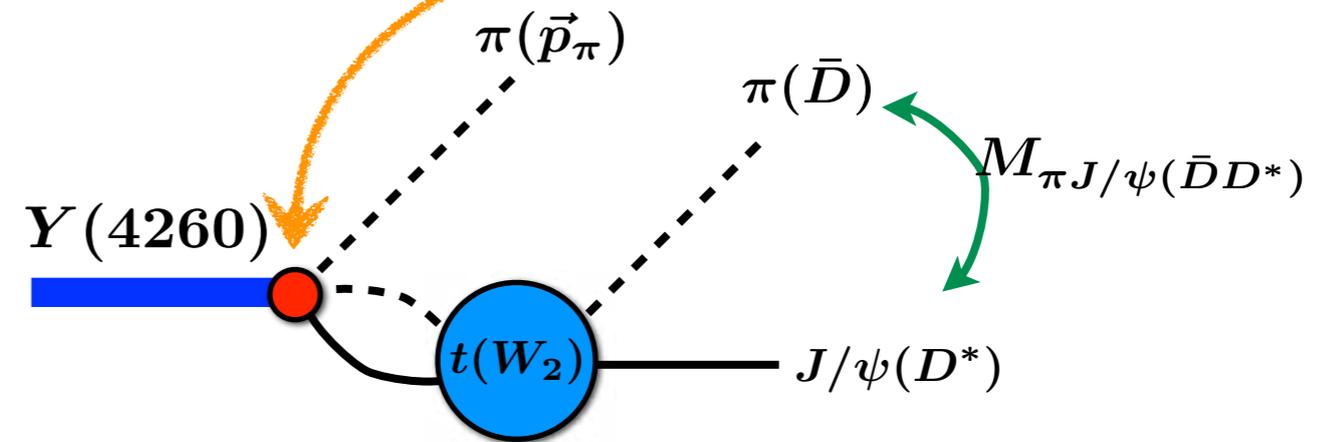

c.f., ~10 parameters needed in models

Invariant mass of 3-body decay

Y. Ikeda [HAL QCD] arXiv:1706.07300.

- **Expt. data well reproduced** by 2 parameters

- Without off-diagonal $V^{\pi J/\psi, D^0\bar{D}^0}$ (dashed curves), peak structures are not reproduced.

conclusion: $Z_c(3900)$ is threshold cusp caused by strong $V^{\pi J/\psi, D^0\bar{D}^0}$

Summary

✿ “Mirages” in temporal correlation functions

- Fake plateaux can always appear due to contaminations from unavoidable scattering states
- One has to take data at $t \sim 10\text{fm}$ (at least the variational method mandatory)

Iritani, Doi et al. [HAL QCD], JHEP10 (2016) 101.

Iritani et al. [HAL QCD], arXiv:1703.07210.

✿ HAL QCD method

- All scattering states share the same 2PI kernel (= solution for “fake plateau” problem)
- Crucial for coupled-channel scatterings

✿ Tetraquark candidate $Z_c(3900)$

- $Z_c(3900)$ is threshold cusp induced by strong $V^{D\bar{D}^*, \pi J/\psi}$
 - pole position very far from scat. axis
 - expt. data of $Y(4260)$ decay well reproduced
 - no peak structure w/o $V^{D\bar{D}^*, \pi J/\psi}$

Ikeda et al. [HAL QCD], PRL117, 242001 (2016).

Ikeda [HAL QCD], arXiv:170607300.

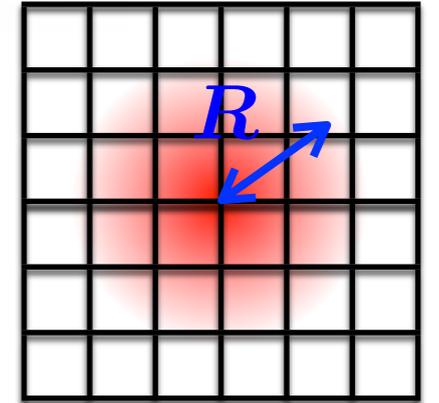

✿ Future: many hadron resonances & nuclear structures at physical point

Thank you for your attention!

“Potential” as representation of S-matrix

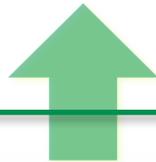

- NBS wave func. in interacting region --> **half-off-shell T-matrix**

$$(\nabla^2 + \vec{k}_n^2)\psi_n(\vec{r}) = 2\mu\mathcal{K}_n(\vec{r}) \quad (|\vec{r}| < R)$$

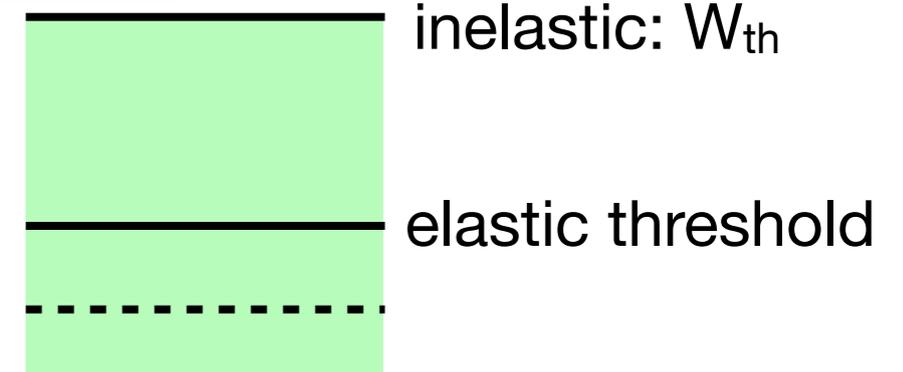

- **Energy-independent** potential (faithful to phase shift)

$$U(\vec{r}, \vec{r}') = \sum_{n \leq W_{th}} \mathcal{K}_n(\vec{r}) \overline{\psi}_n(\vec{r}')$$

★ $U(r, r')$ contains all 2PI contribution

above W_{th} : **coupled-channel analysis**

- “Potential” becomes a kernel of Schrödinger-type equation

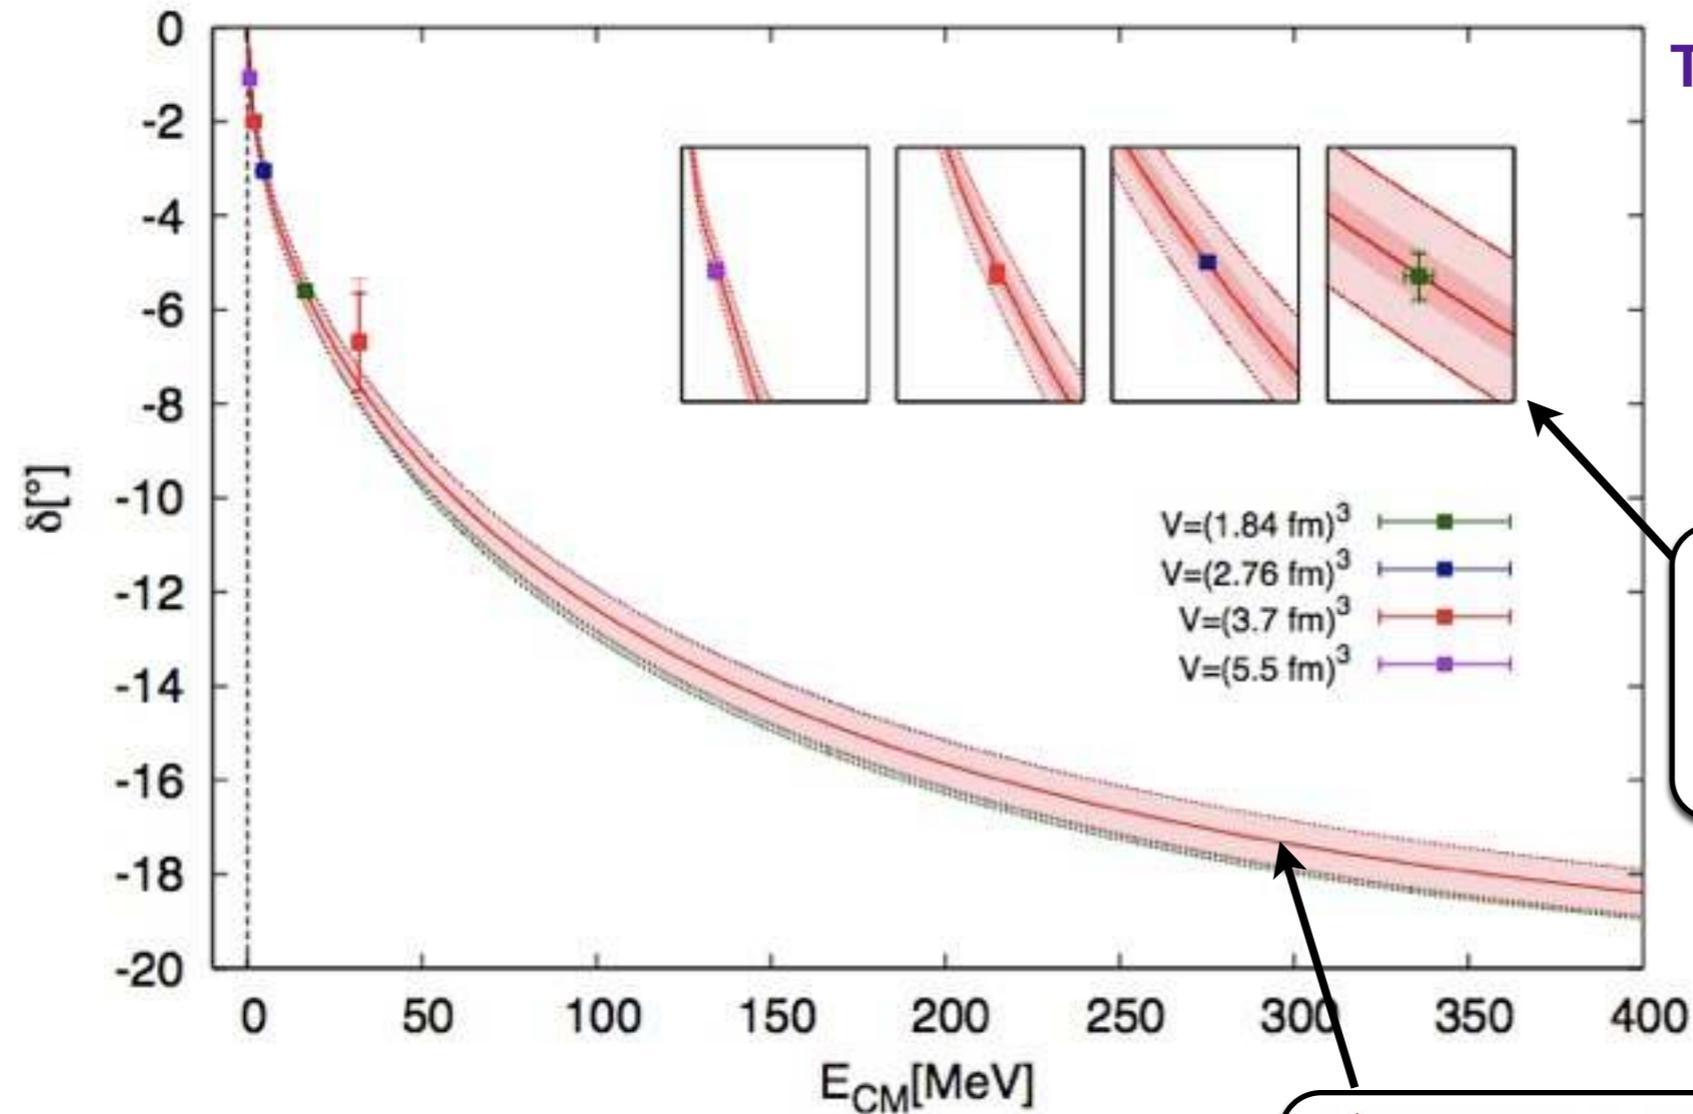

$$\left(\nabla^2 + \vec{k}_n^2\right)\psi_n(\vec{r}) = 2\mu \int d\vec{r}' U(\vec{r}, \vec{r}')\psi_n(\vec{r}')$$

[Aoki, Hatsuda, Ishii, PTP123, 89 \(2010\).](#)

HAL QCD & Lüscher's methods

$I=2$ $\pi\pi$ S-wave phase shift from HAL QCD & Lüscher's methods

T. Kurth et al., JHEP 1312 (2013) 015.

◆ Quench QCD

$m_\pi \sim 940 \text{ MeV}$, $a=0.115 \text{ fm}$

$V \times T = (16^3, 24^3, 32^3, 48^3) \times 128$

◆ Lüscher's method (points)

$$k \cot \delta(k) \equiv \frac{1}{\pi L} \sum_{\vec{n} \in \mathbf{Z}} \frac{1}{|\vec{n}|^2 - \tilde{k}^2}$$

◆ HAL QCD (red band)

$$\left[-\partial_\tau + \nabla^2 / 2\mu + \partial_\tau^2 / 8\mu \right] R(\vec{r}, \tau) \equiv V(\vec{r}) R(\vec{r}, \tau)$$

Both methods agree (theoretically identical)

Nonlocality of potentials

✓ Velocity expansion:

$$U(\vec{r}, \vec{r}') = V(\vec{r}, \nabla) \delta(\vec{r} - \vec{r}') \quad \begin{array}{l} \text{(LO)} \\ \text{(NLO)} \end{array}$$

→ $V(\vec{r}, \nabla) \equiv V_C(\vec{r}) + \vec{L} \cdot \vec{S} V_{LS}(\vec{r}) + \mathcal{O}(\nabla^2)$

✓ Derive (effective) leading order potential in velocity expansion:

$$\left[\nabla^2 / 2\mu^a - \partial_\tau \right] R(\vec{r}, \tau) = V_{\text{eff}}(\vec{r}) R(\vec{r}, \tau)$$

$$R(\vec{r}, \tau) = A_1 e^{-\Delta W_1 \tau} \psi_1(\vec{r}) + A_2 e^{-\Delta W_2 \tau} \psi_2(\vec{r}) + \dots$$

✓ Check of nonlocality (energy-independent **local** potential is good approximation?)

$$V_{\text{eff}}(\vec{r}) \psi_1(\vec{r}) = \left(\frac{\nabla^2}{2\mu} + \frac{\vec{k}_1^2}{2\mu} \right) \psi_1(\vec{r})$$

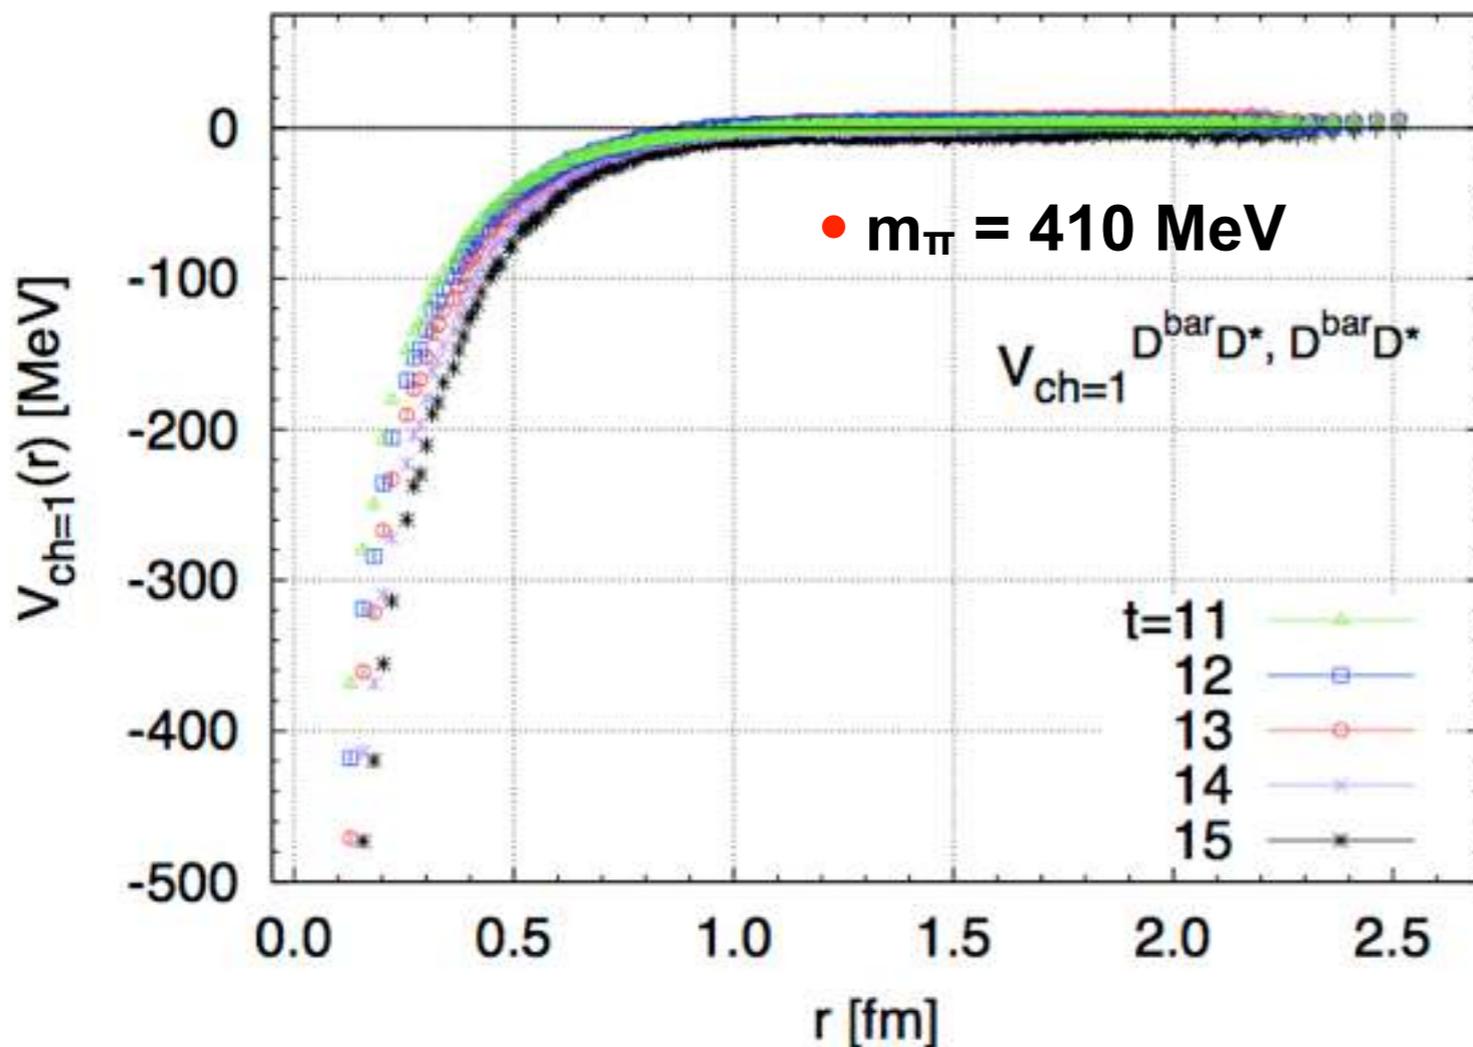

$$V_{\text{eff}}(\vec{r}) \psi_2(\vec{r}) = \left(\frac{\nabla^2}{2\mu} + \frac{\vec{k}_2^2}{2\mu} \right) \psi_2(\vec{r})$$

✓ nonlocality --> energy-dependence of local potential

➔ Local potential shows **time-slice dependence**

$D^{\text{bar}}D^*$ potential (single-channel)

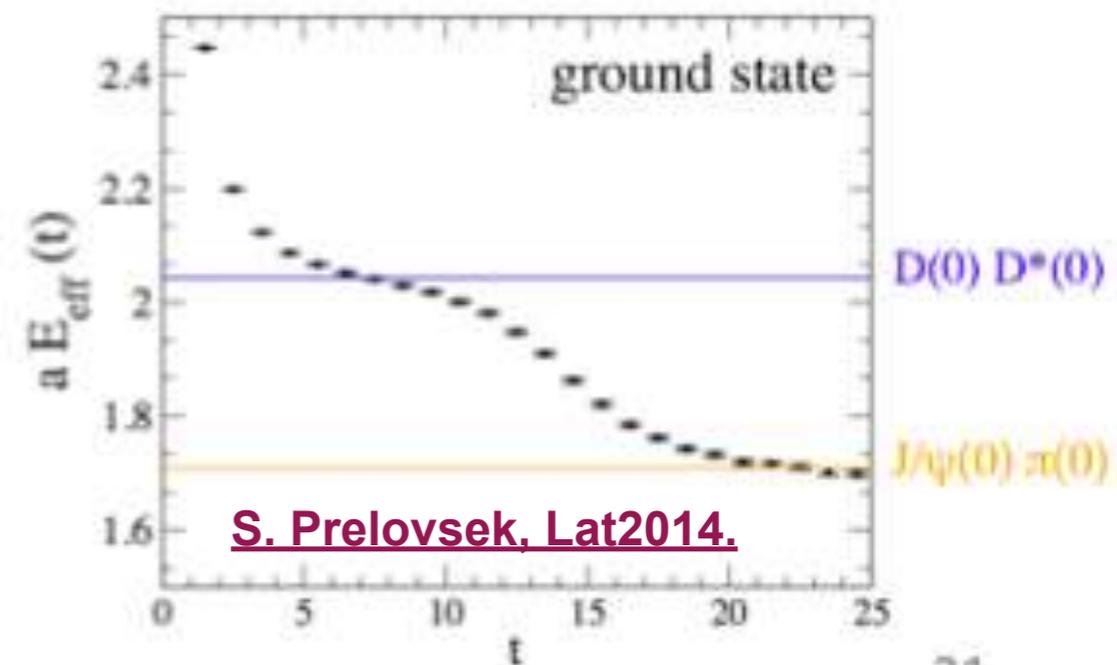

- $D^{\text{bar}}D^*$: inelastic channel

$$\underline{D^{\text{bar}}D^* = 3959}$$

$$\Delta = 451$$

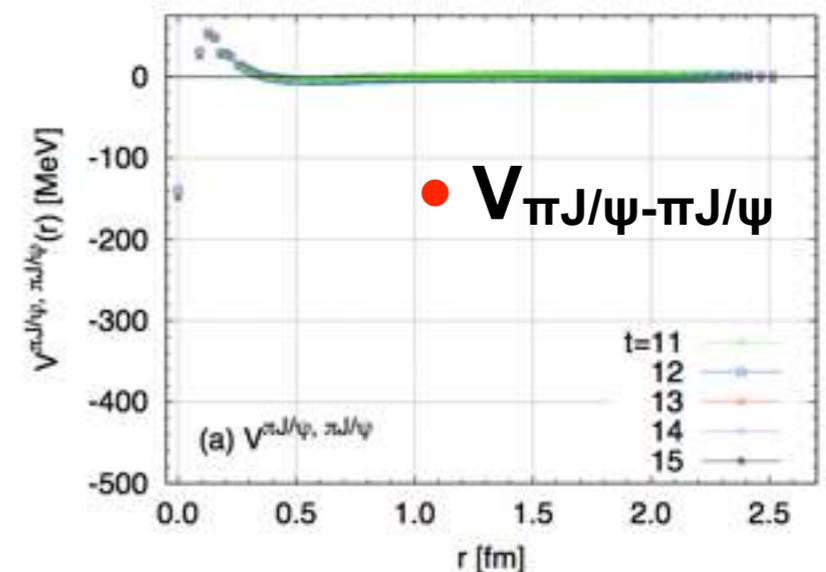

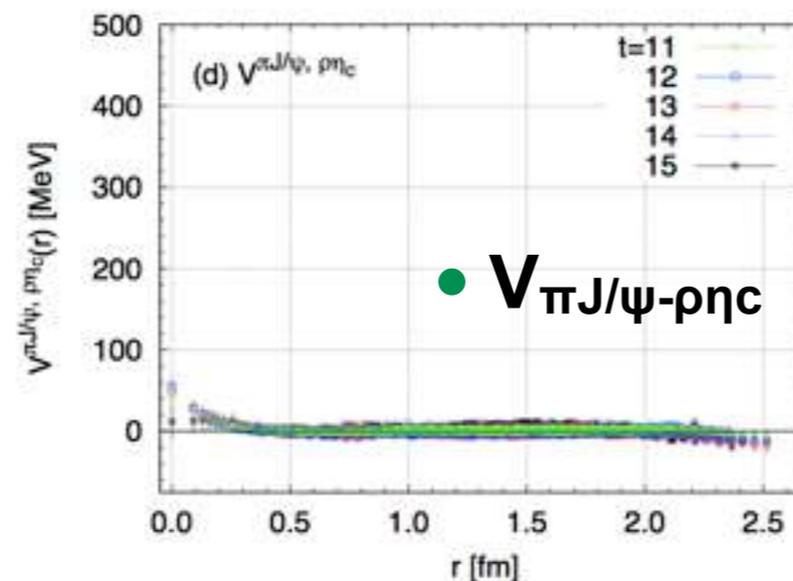

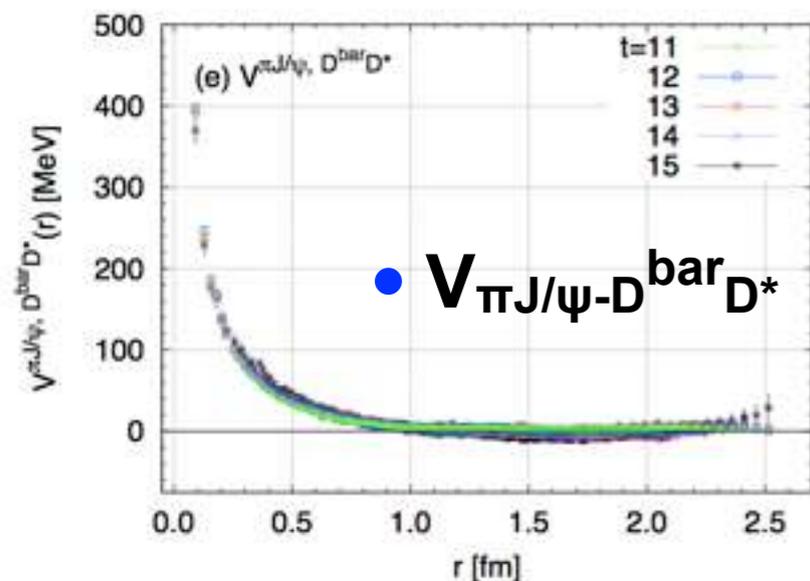

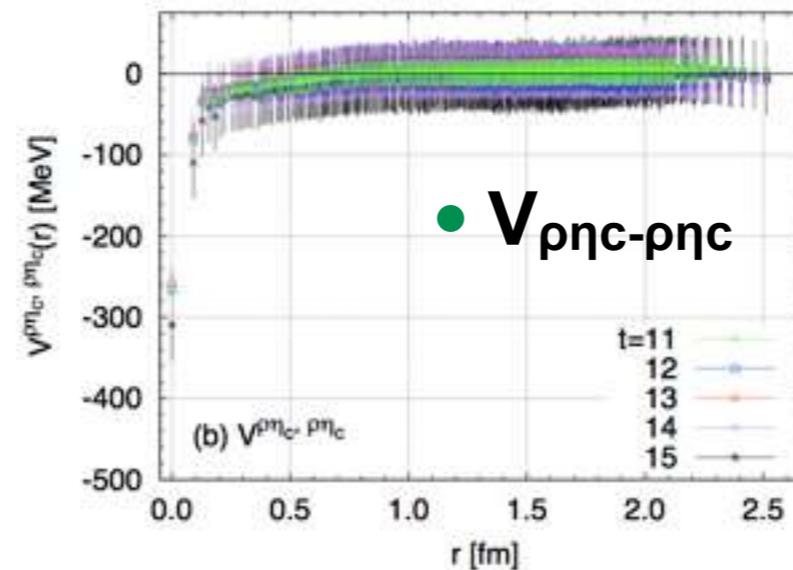

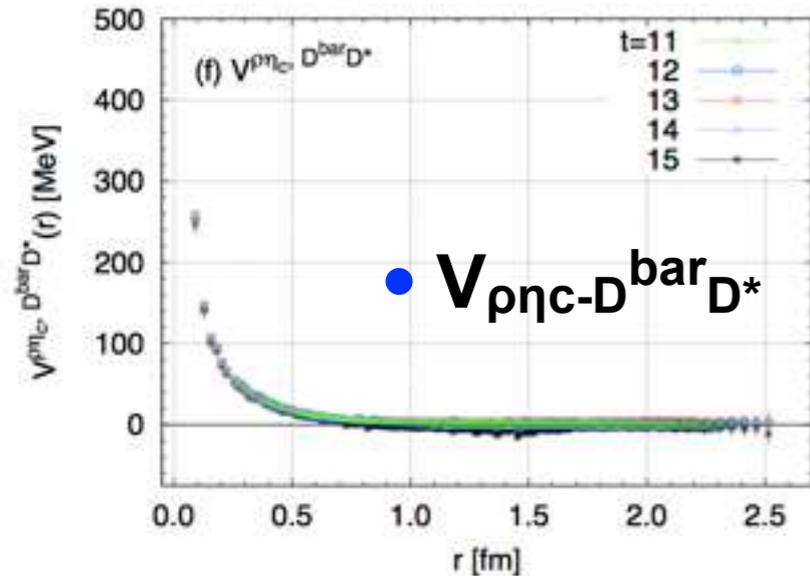

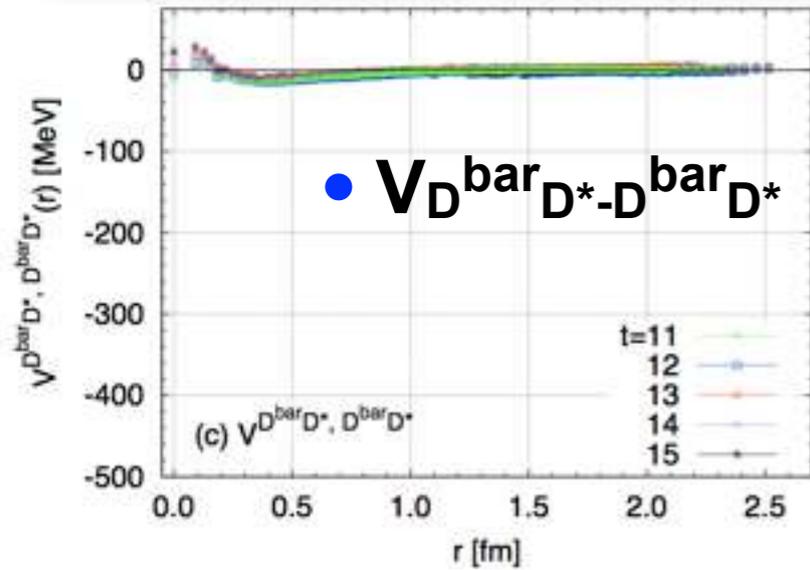

$$\underline{\pi J/\psi = 3508}$$

- Time-slice dependence indicates
 - ➔ coupling to lower channels (large contribution from $\pi J/\psi$ and/or $\rho \eta_c$)
 - ➔ single channel $D^{\text{bar}}D^*$ potential NOT well defined
 - ➔ **coupled-channel analysis is necessary**

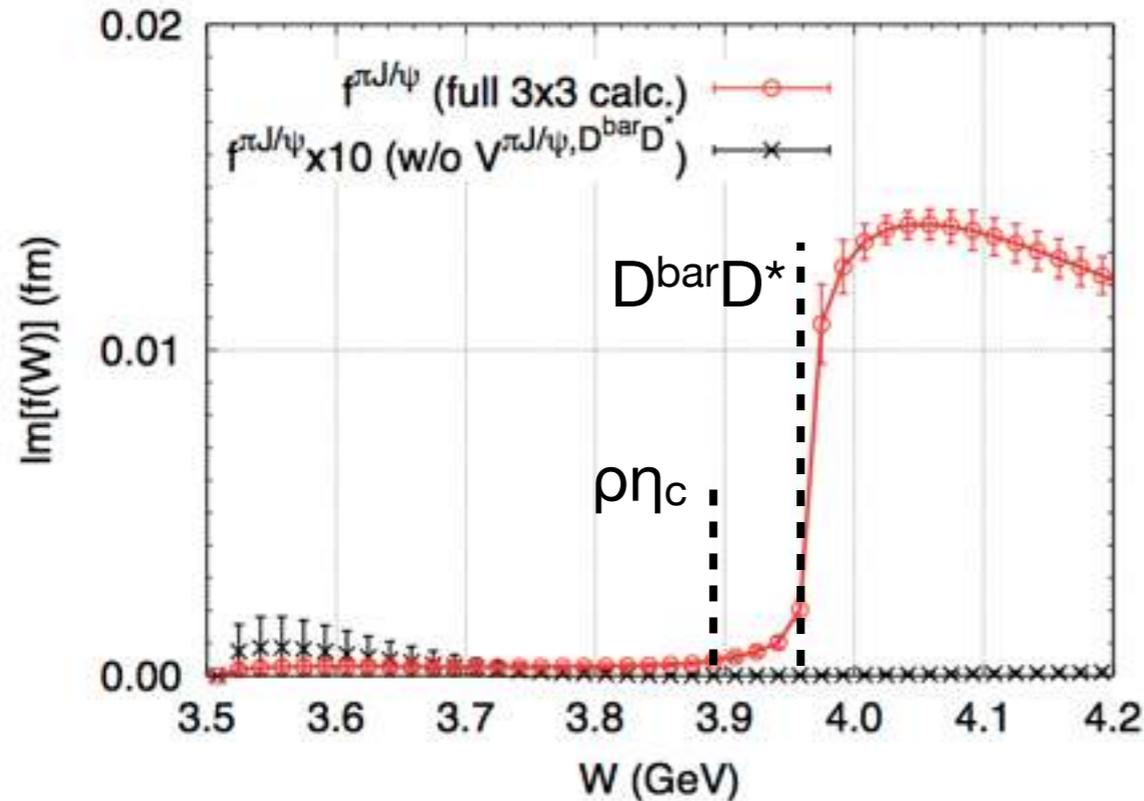

t-dependence on potential matrix

- check of non-locality of potential ($m_\pi=410\text{MeV}$)
 - all $V(t=11-15)$ are consistent within stat. errors
 - ➔ non-locality of potential is weak

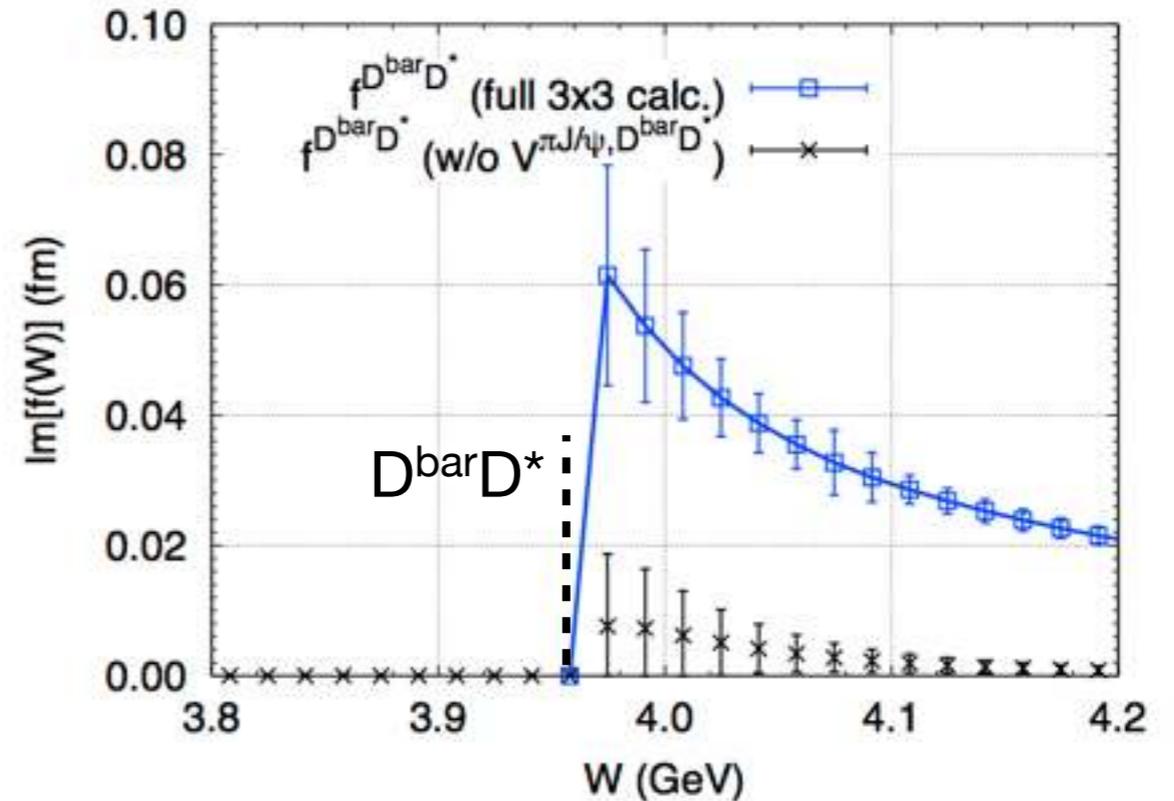

Amplitudes in $\pi J/\psi$ & $D^{\text{bar}}D^*$ (2-body scat.)

- $\pi J/\psi$ invariant mass

- $D^{\text{bar}}D^*$ invariant mass

$$\frac{\Gamma(Z_c(3900) \rightarrow \bar{D}D^*)}{\Gamma(Z_c(3900) \rightarrow \pi J/\psi)} = 6.2(1.1)(2.7)$$

BESIII Coll., PRL112 (2014).

✓ Obtained amplitudes consistent with decay ratio in expt.

Invariant mass spectra of $\pi J/\psi$ & $D^{\text{bar}}D^*$

● $\pi J/\psi$ invariant mass

● $m_\pi=410\text{MeV}$

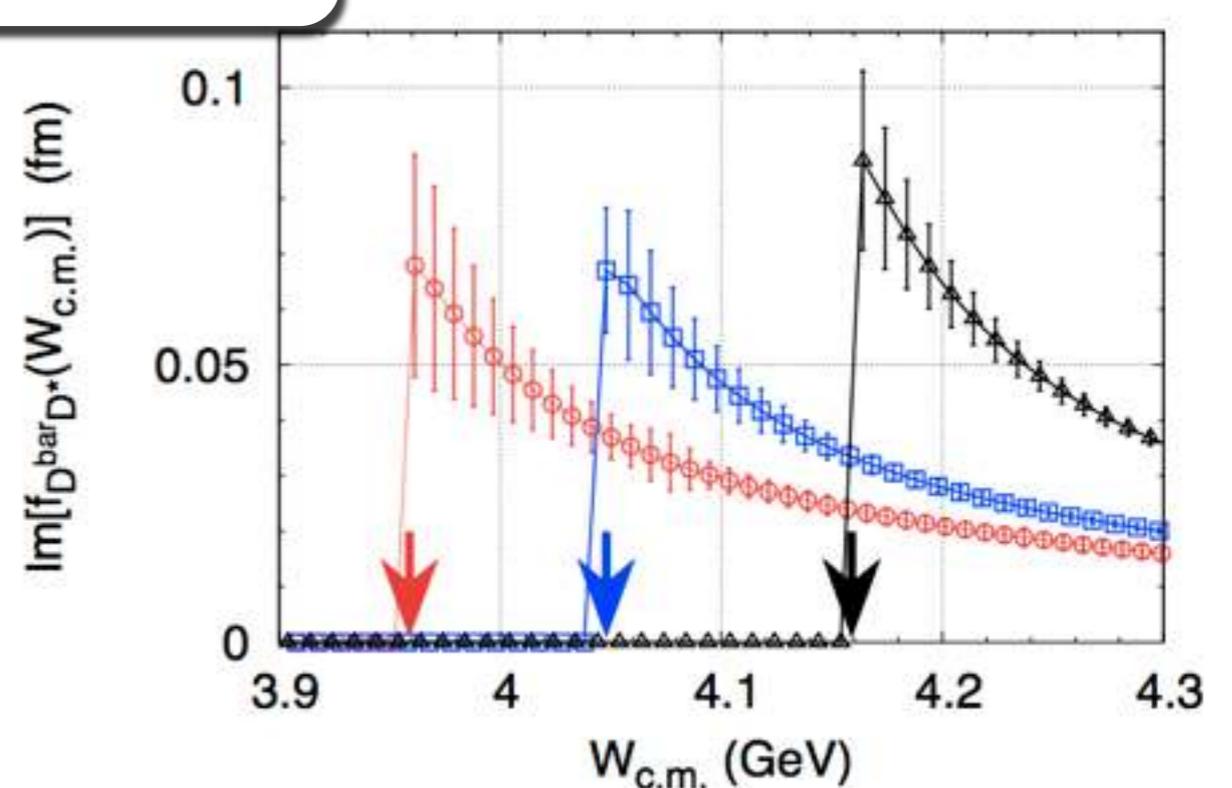

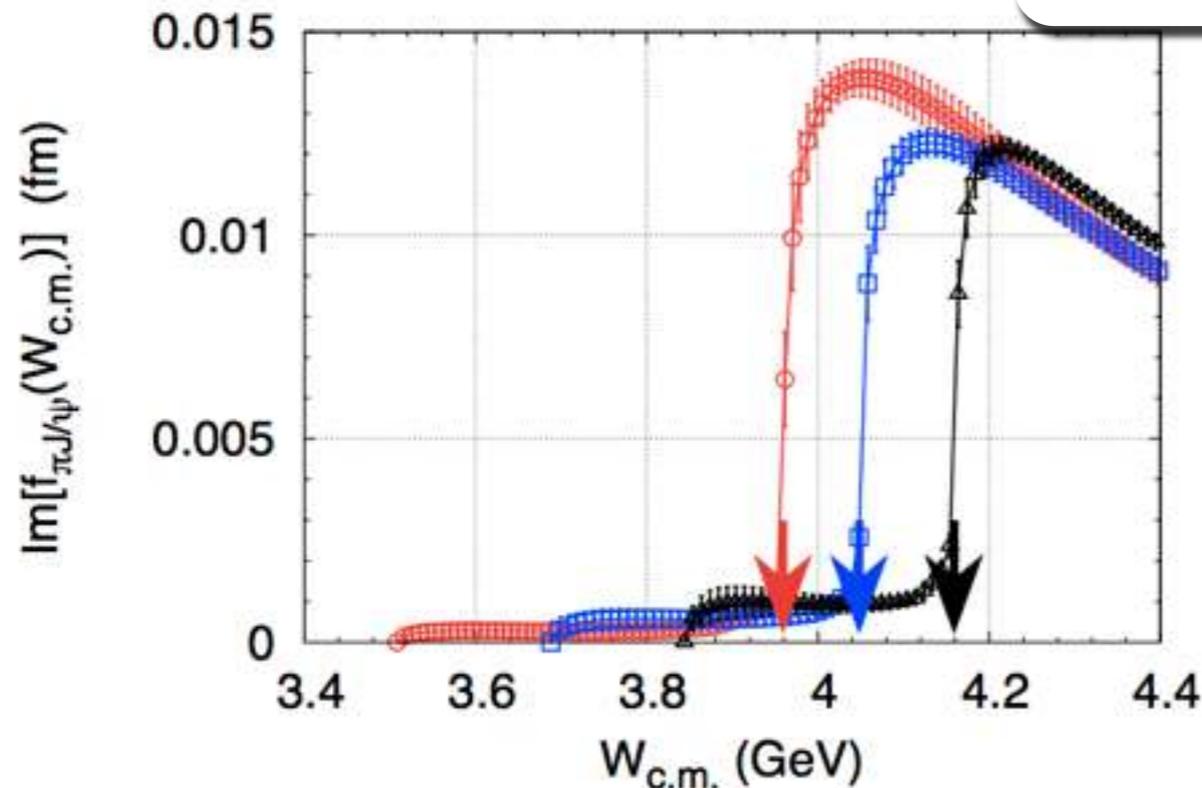

● $m_\pi=570\text{MeV}$

● $m_\pi=700\text{MeV}$

● $D^{\text{bar}}D^*$ invariant mass

✓ Enhancement near $D^{\text{bar}}D^*$ threshold due to large $\pi J/\psi$ - $D^{\text{bar}}D^*$ coupling

● Peak in $\pi J/\psi$ invariant mass (Not Breit-Wigner line shape)

● Threshold enhancement in $D^{\text{bar}}D^*$ invariant mass (cusp behavior)

(No m_q dependence on qualitative behaviors of line shapes)

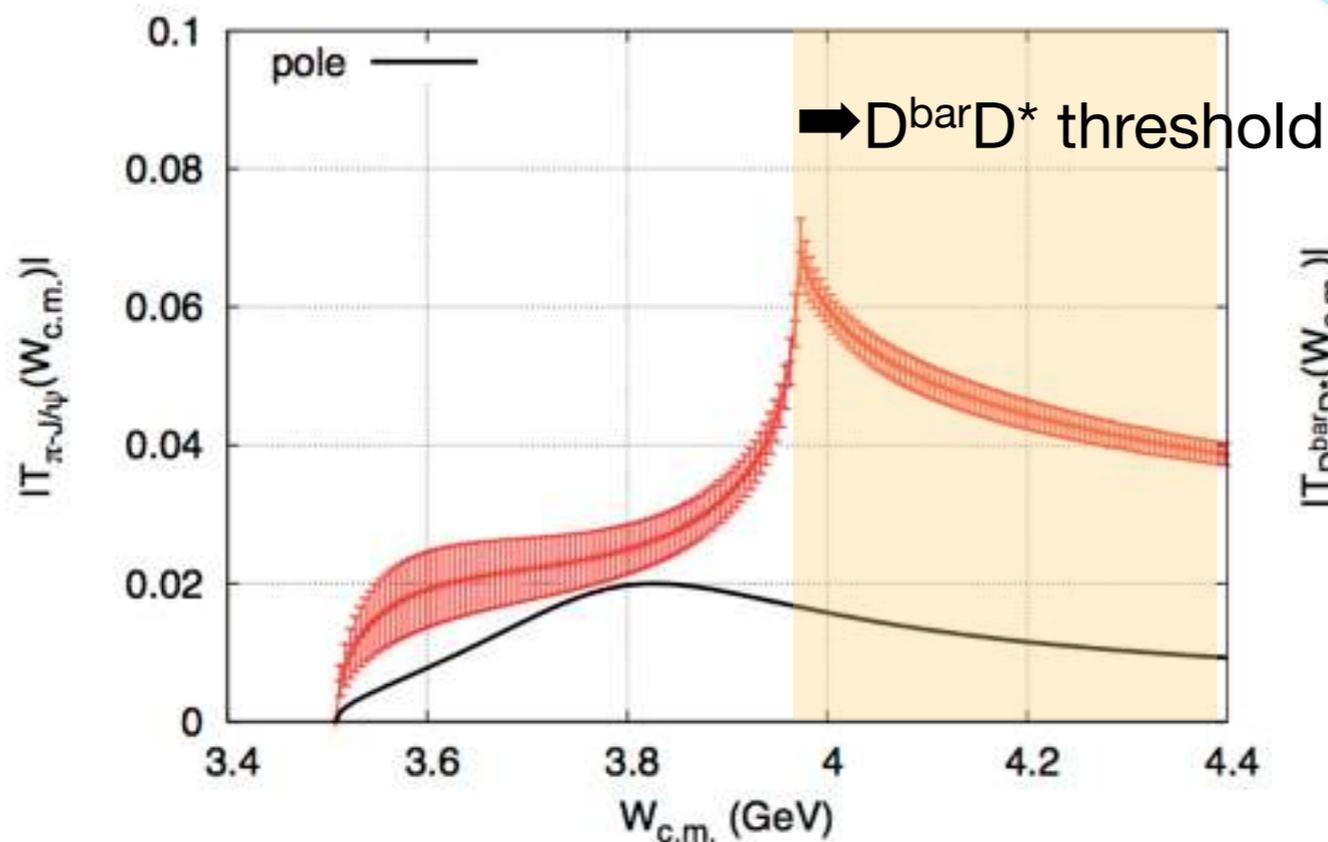

➡ Is $Z_c(3900)$ a conventional resonance?

T-matrix of $\pi J/\psi$ & $D^{\text{bar}}D^*$

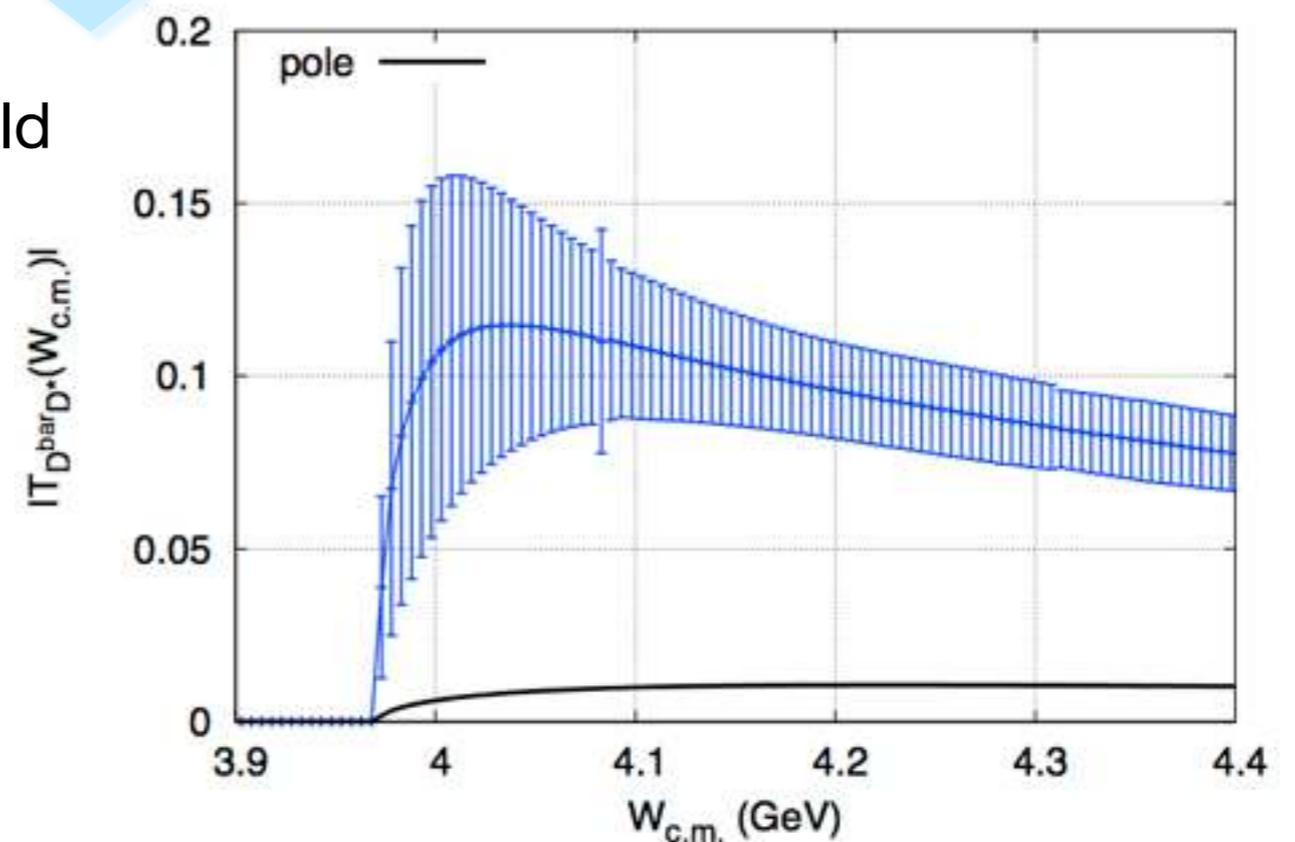

- calculate residues of T-matrices in $\pi J/\psi$ & $D^{\text{bar}}D^*$ channels

$$S(k) = 1 + 2iT(k)$$

- $\pi J/\psi$ - $\pi J/\psi$ T-matrix

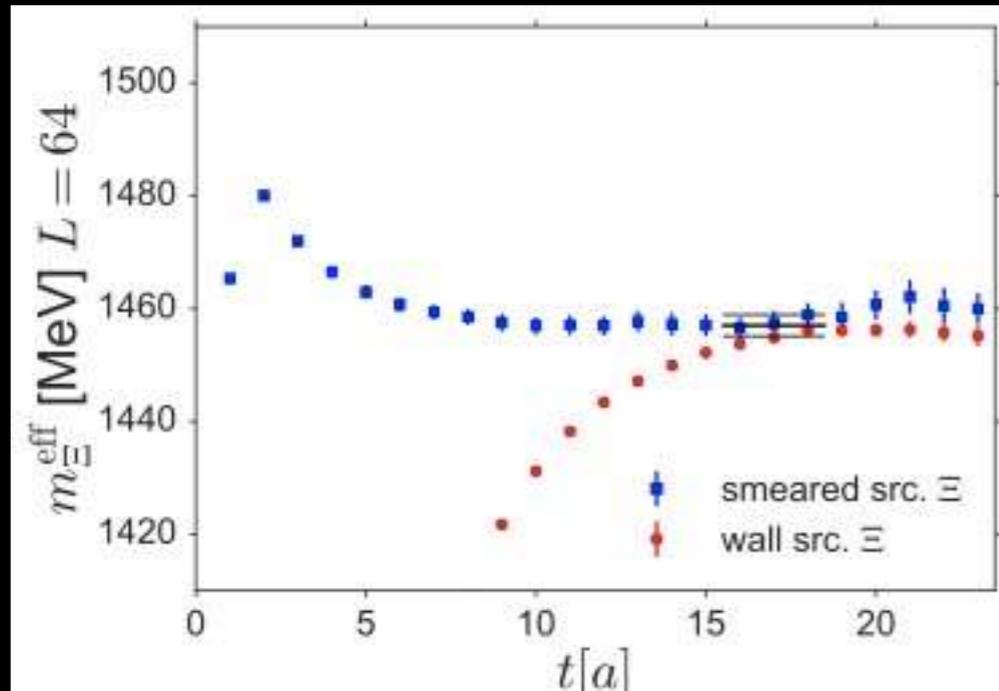

- $D^{\text{bar}}D^*$ - $D^{\text{bar}}D^*$ T-matrix

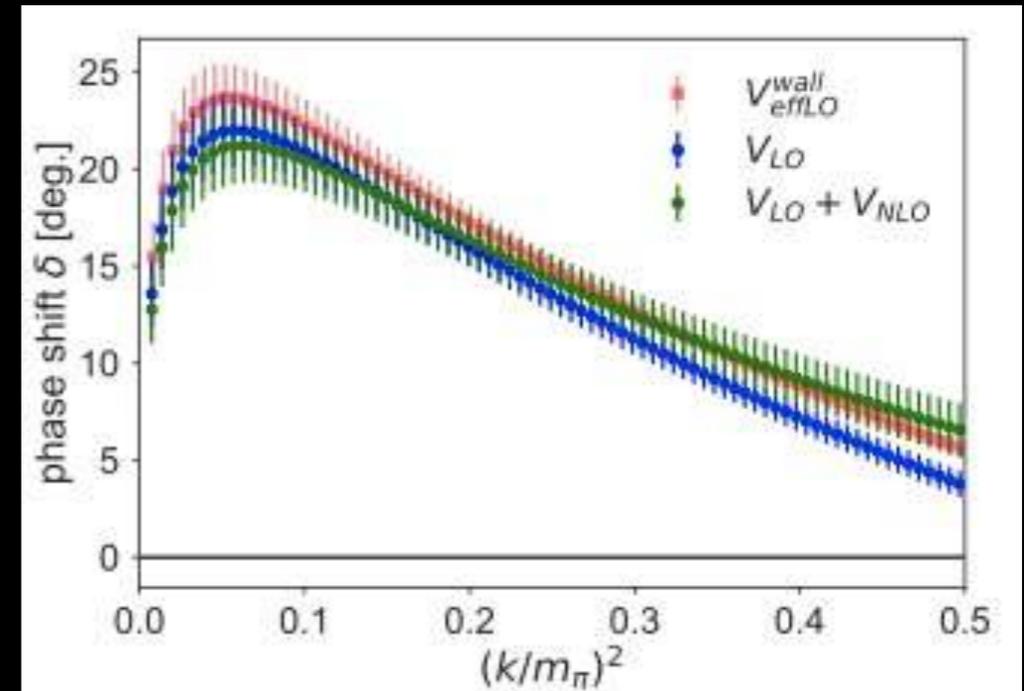

- contribution from virtual pole to T-matrix is small
- $Z_c(3900)$ is cusp at $D^{\text{bar}}D^*$ threshold induced by off-diagonal $V_{\pi\psi, D^{\text{bar}}D^*}$

HAL QCD data in $\Xi\Xi$ (1S_0) -- systematics --

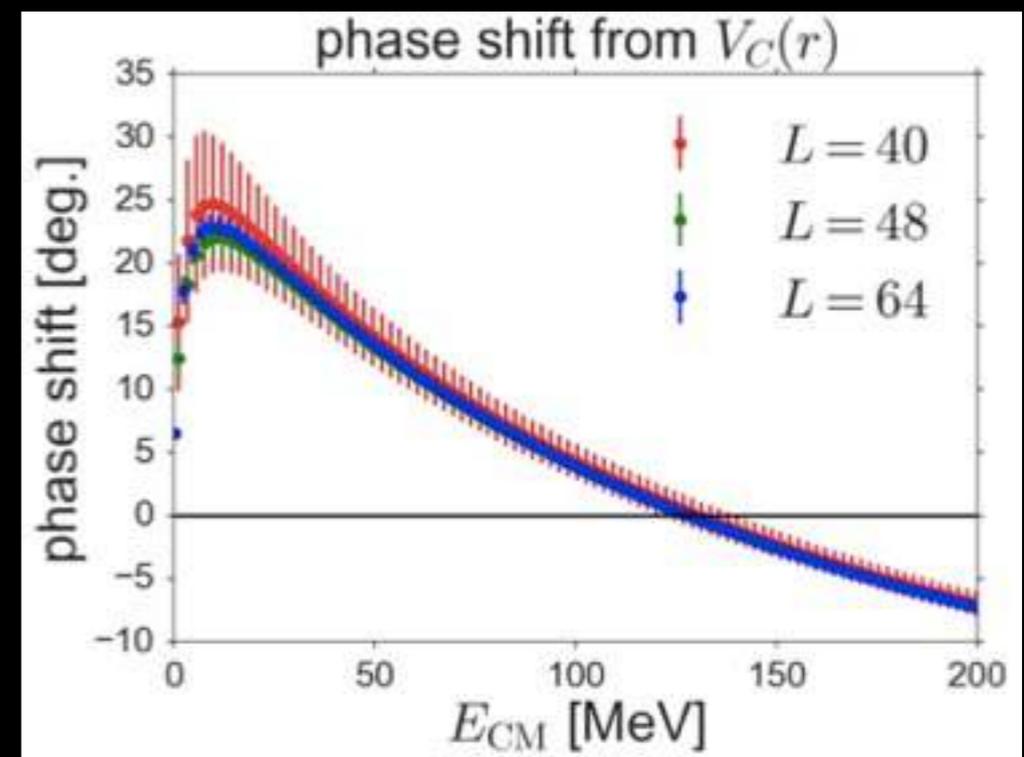

✓ single hadron effective mass

✓ convergence of derivative expansion

✓ Volume dependence of observable

see talk by T. Iritani (Parallel, Hadron Spectroscopy and Interactions on Thur.)

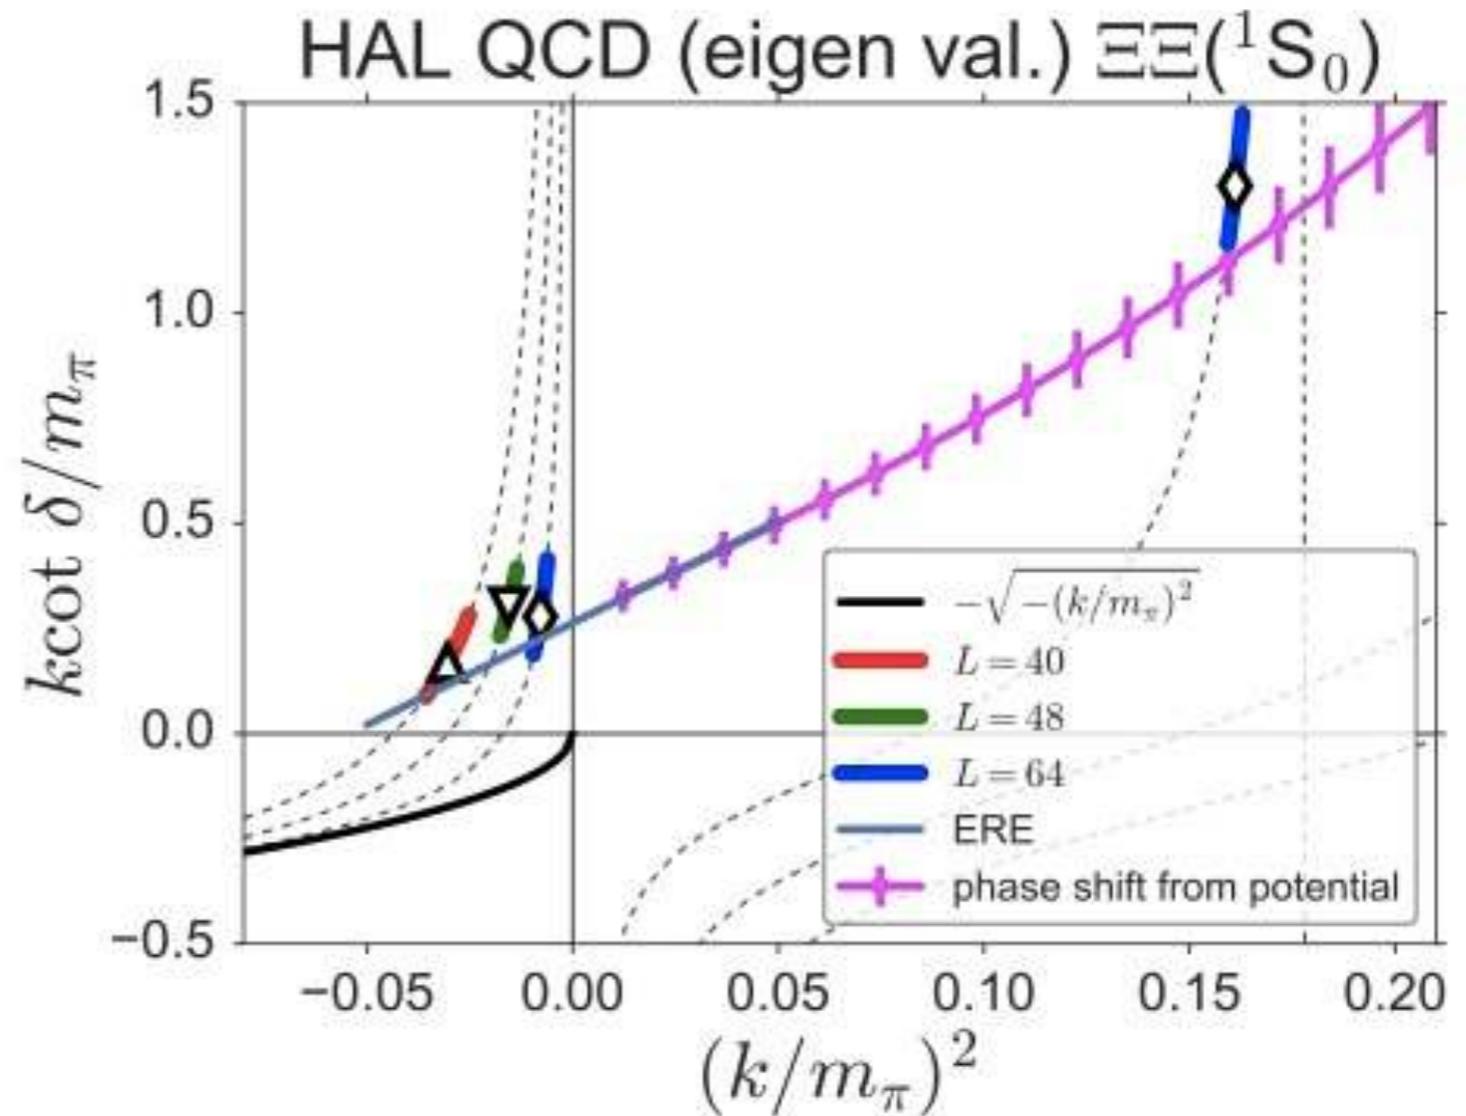

Sanity check for HAL QCD data

✓ phase shift from Lüscher's formula shows **reasonable behavior**

- finite volume energy shift
 $\Delta E_L \rightarrow \frac{k \cot \delta(k)}{L}$
at $L = 40, 48, 64$

- potential $V(r)$
 \rightarrow phase shift δ

- Effective Range Expansion
 $k \cot \delta = \frac{1}{a_0} + \frac{1}{2} r_{\text{eff}} k^2$

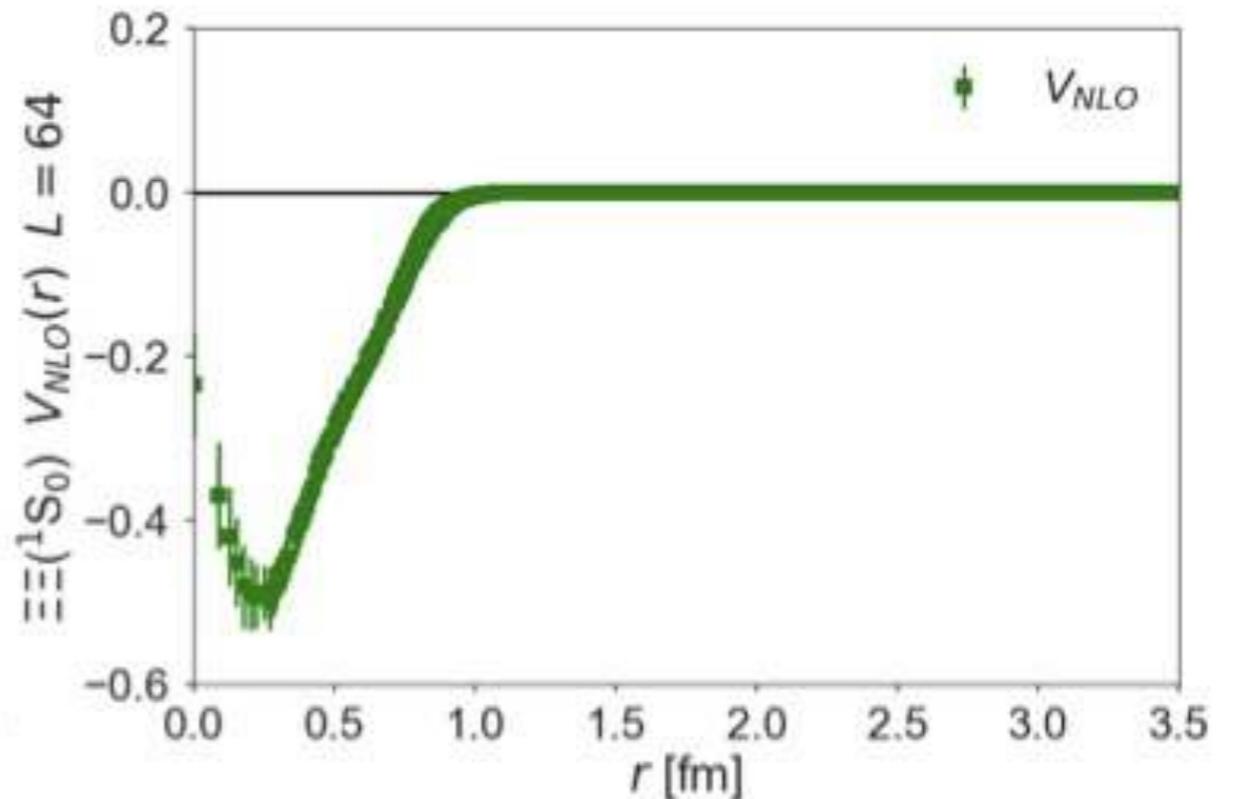

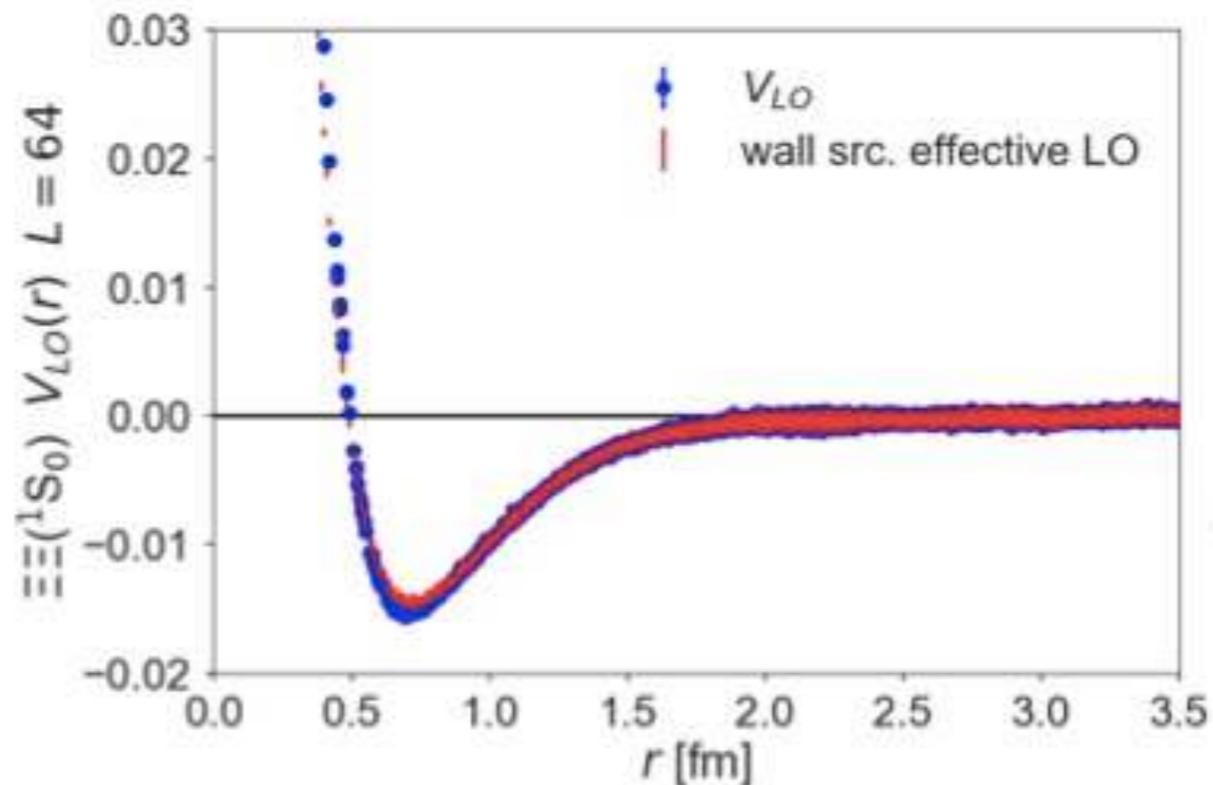

NLO potential in $\Xi\Xi$ (1S_0) channel

$$U(\vec{r}, \vec{r}') = [V_{\text{eff}}(\vec{r})] \delta(\vec{r} - \vec{r}')$$

$$U(\vec{r}, \vec{r}') = [V_{\text{LO}}(\vec{r}) + V_{\text{NLO}}(\vec{r}) \nabla^2] \delta(\vec{r} - \vec{r}')$$

► $V_{\text{LO}}(r)$ and $V_{\text{NLO}}(r)$

Contamination from elastic states in $\Xi\Xi$ (1S_0) channel

HAL pot. \blacktriangleright eigenfunc/value $\Psi_n, \Delta E_n$ \blacktriangleright eigenmode decomposition

$$R^{\text{wall/smear}}(\vec{r}, t) = \sum_n a_n^{\text{wall/smear}} \Psi_n(\vec{r}) \exp(-\Delta E_n t)$$

$$\therefore R(t) \equiv R(\vec{p} = 0, t) = \sum_r R(\vec{r}, t) = \sum_n b_n^{\text{wall/smear}} e^{-\Delta E_n t}$$

\square ex. **1st excited state**

- **wall source**

$$b_1/b_0 \ll 1 \%$$

- **smeared source[†]**

$$b_1/b_0 \simeq -10 \%$$

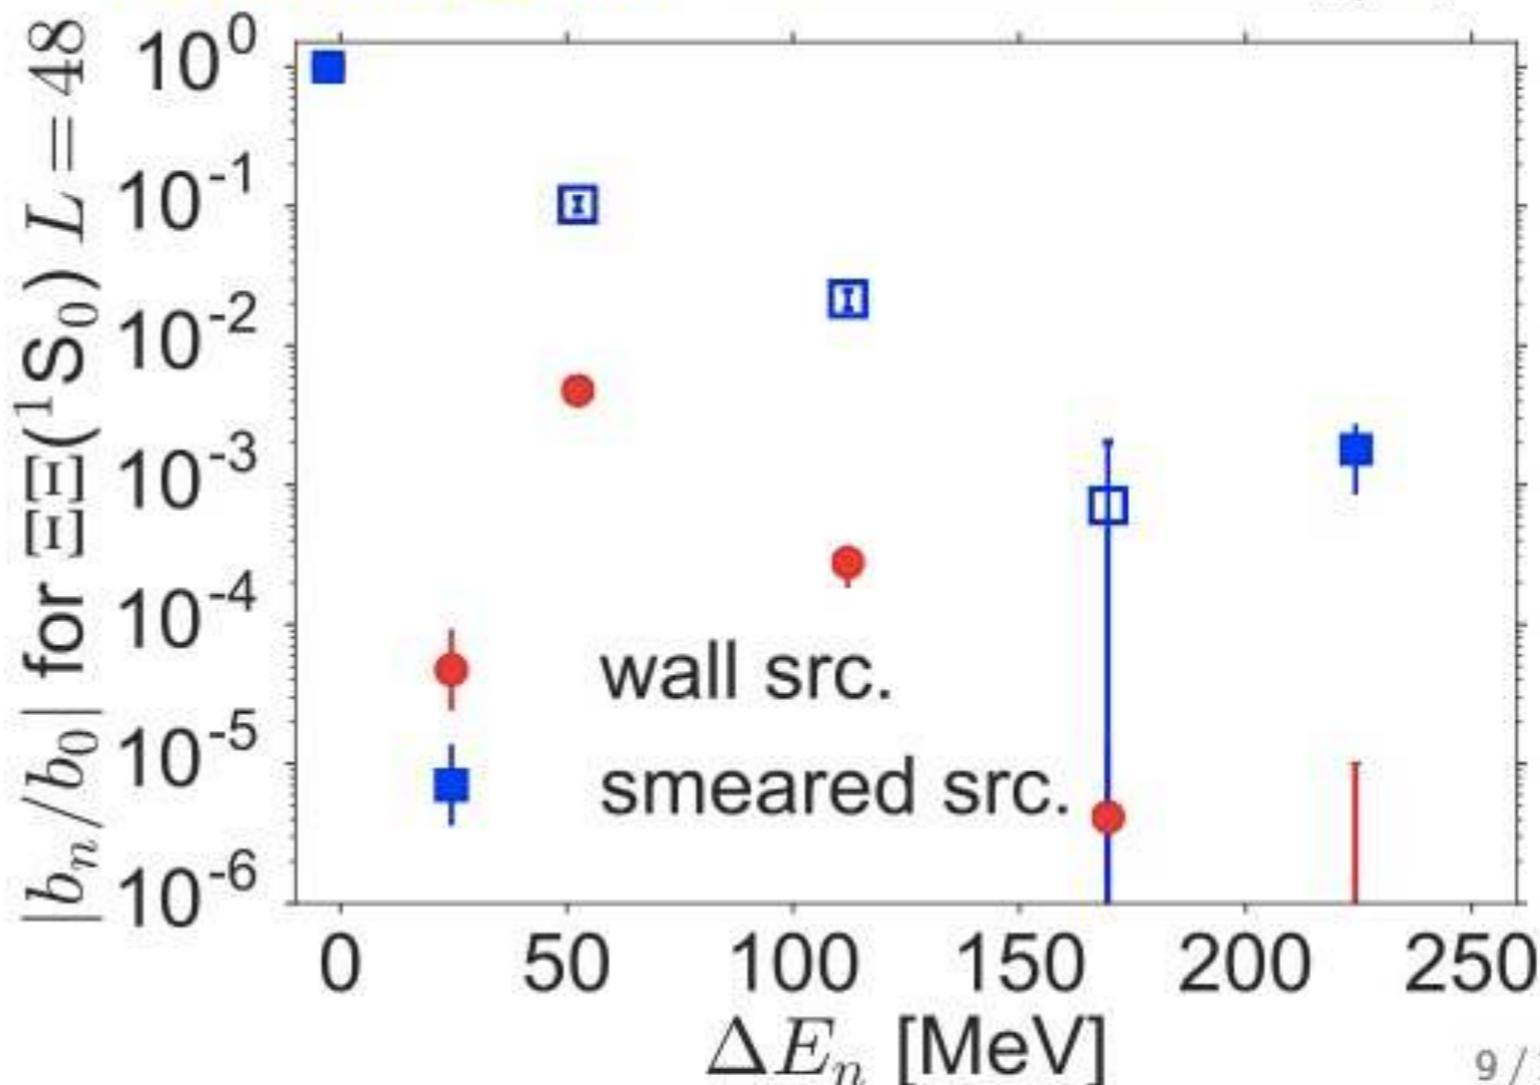

- with energy gap

$$E_1 - E_0 \simeq 50 \text{ MeV}$$

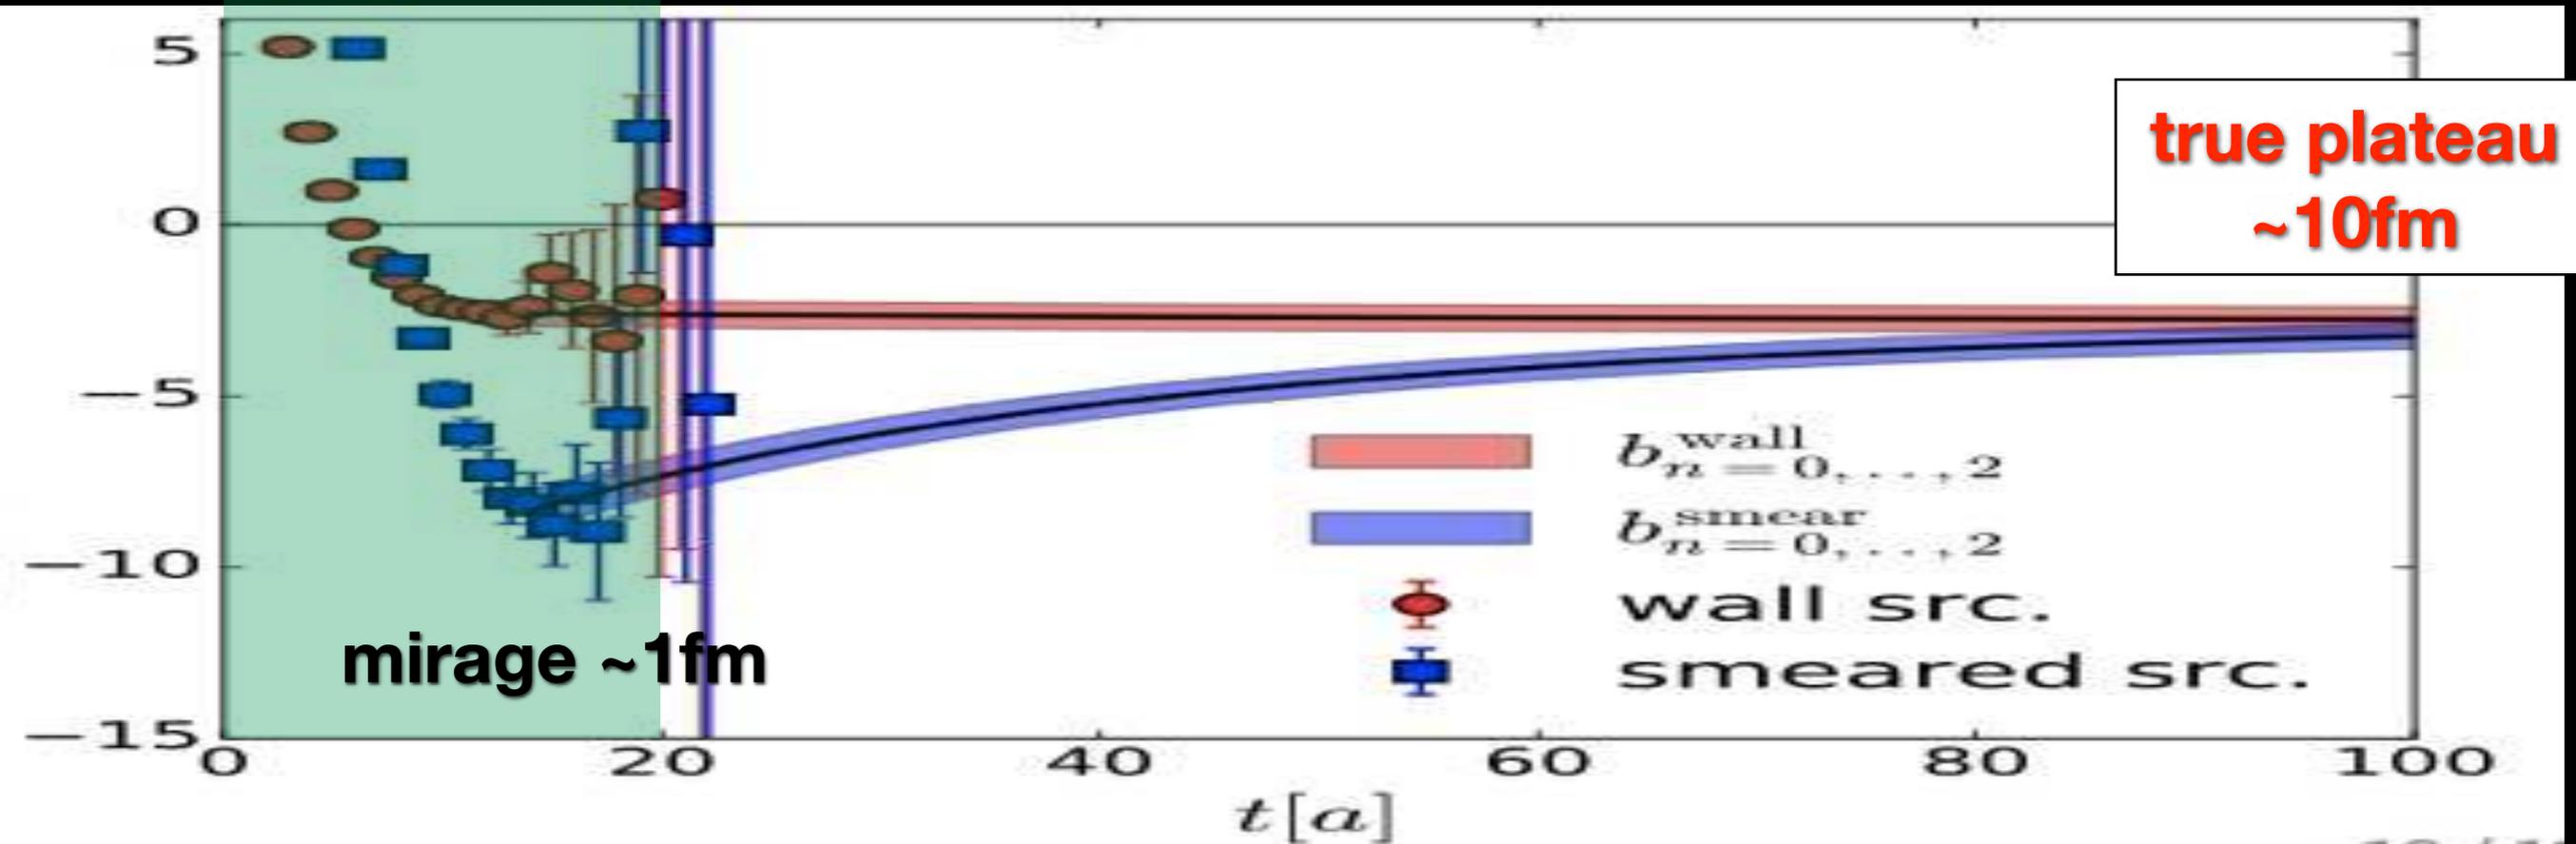

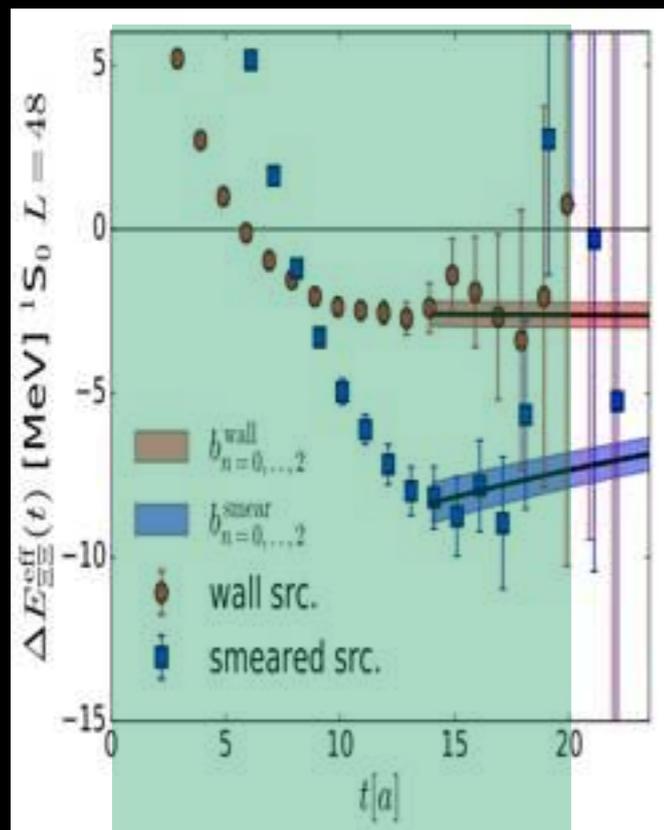

for $L^3 = 48^3$

[†]unfilled symbols: $b_n/b_0 < 0$

“contamination” of excited states b_n/b_0

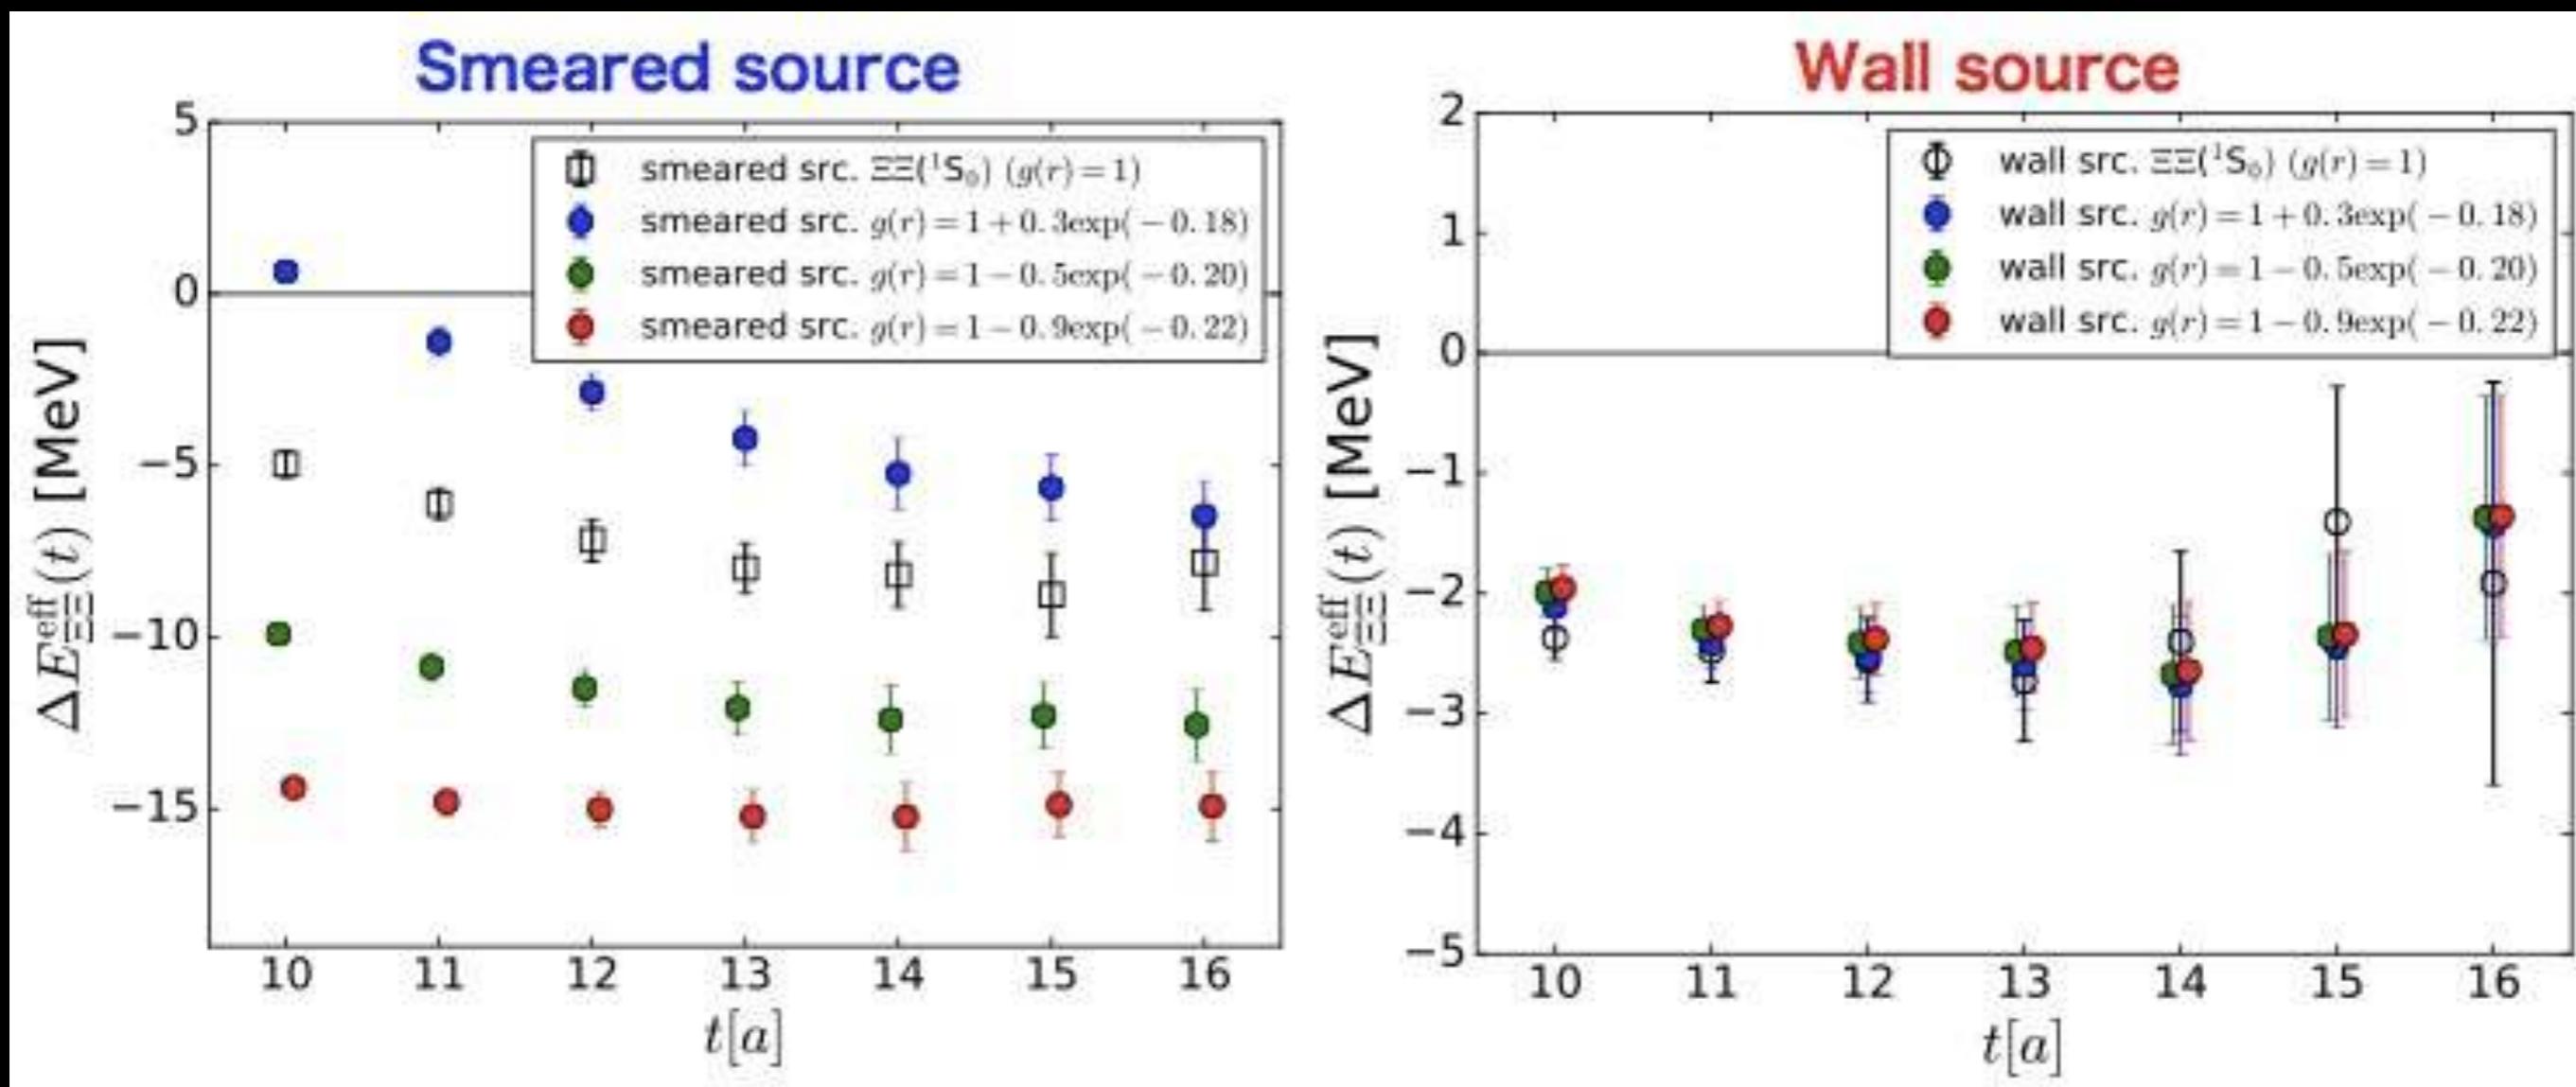

Fate of “fake plateau” in $\Xi\Xi$ (1S_0) channel

Sink operator dependence in $\Xi\Xi$ (1S_0) channel

$$R(t) = \sum_{\vec{r}} g(\vec{r}) \sum_{\vec{x}} \langle 0 | B_1(\vec{x} + \vec{r}, t) B_2(\vec{x}, t) \mathcal{J}^\dagger(t=0) | 0 \rangle / C_B(t)^2$$

**Smearred source is very sensitive to the choice of sink operators.
On the other hand, wall source is insensitive.**

On the comment on “sanity check” by NPLQCD

NPL2017C Comment on “Are two nucleons bound in lattice QCD for heavy quark masses? - Sanity check with Lüscher’s finite volume formula -”

Data	$NN(^1S_0)$			$NN(^3S_1)$				
	Source independence	(i)	(ii)	(iii)	Source independence	(i)	(ii)	(iii)
NPL2013 [27,28]	No			No	No			No

NPL claimed that the above table in our paper should be replaced by

Data	$NN(^1S_0)$			$NN(^3S_1)$				
	Source independence	(i)	(ii)	(iii)	Source independence	(i)	(ii)	(iii)
NPL2013 [27,28]	Yes	Passed	Passed	Passed	Yes	Passed	Passed	Passed

Source independence was already discussed:

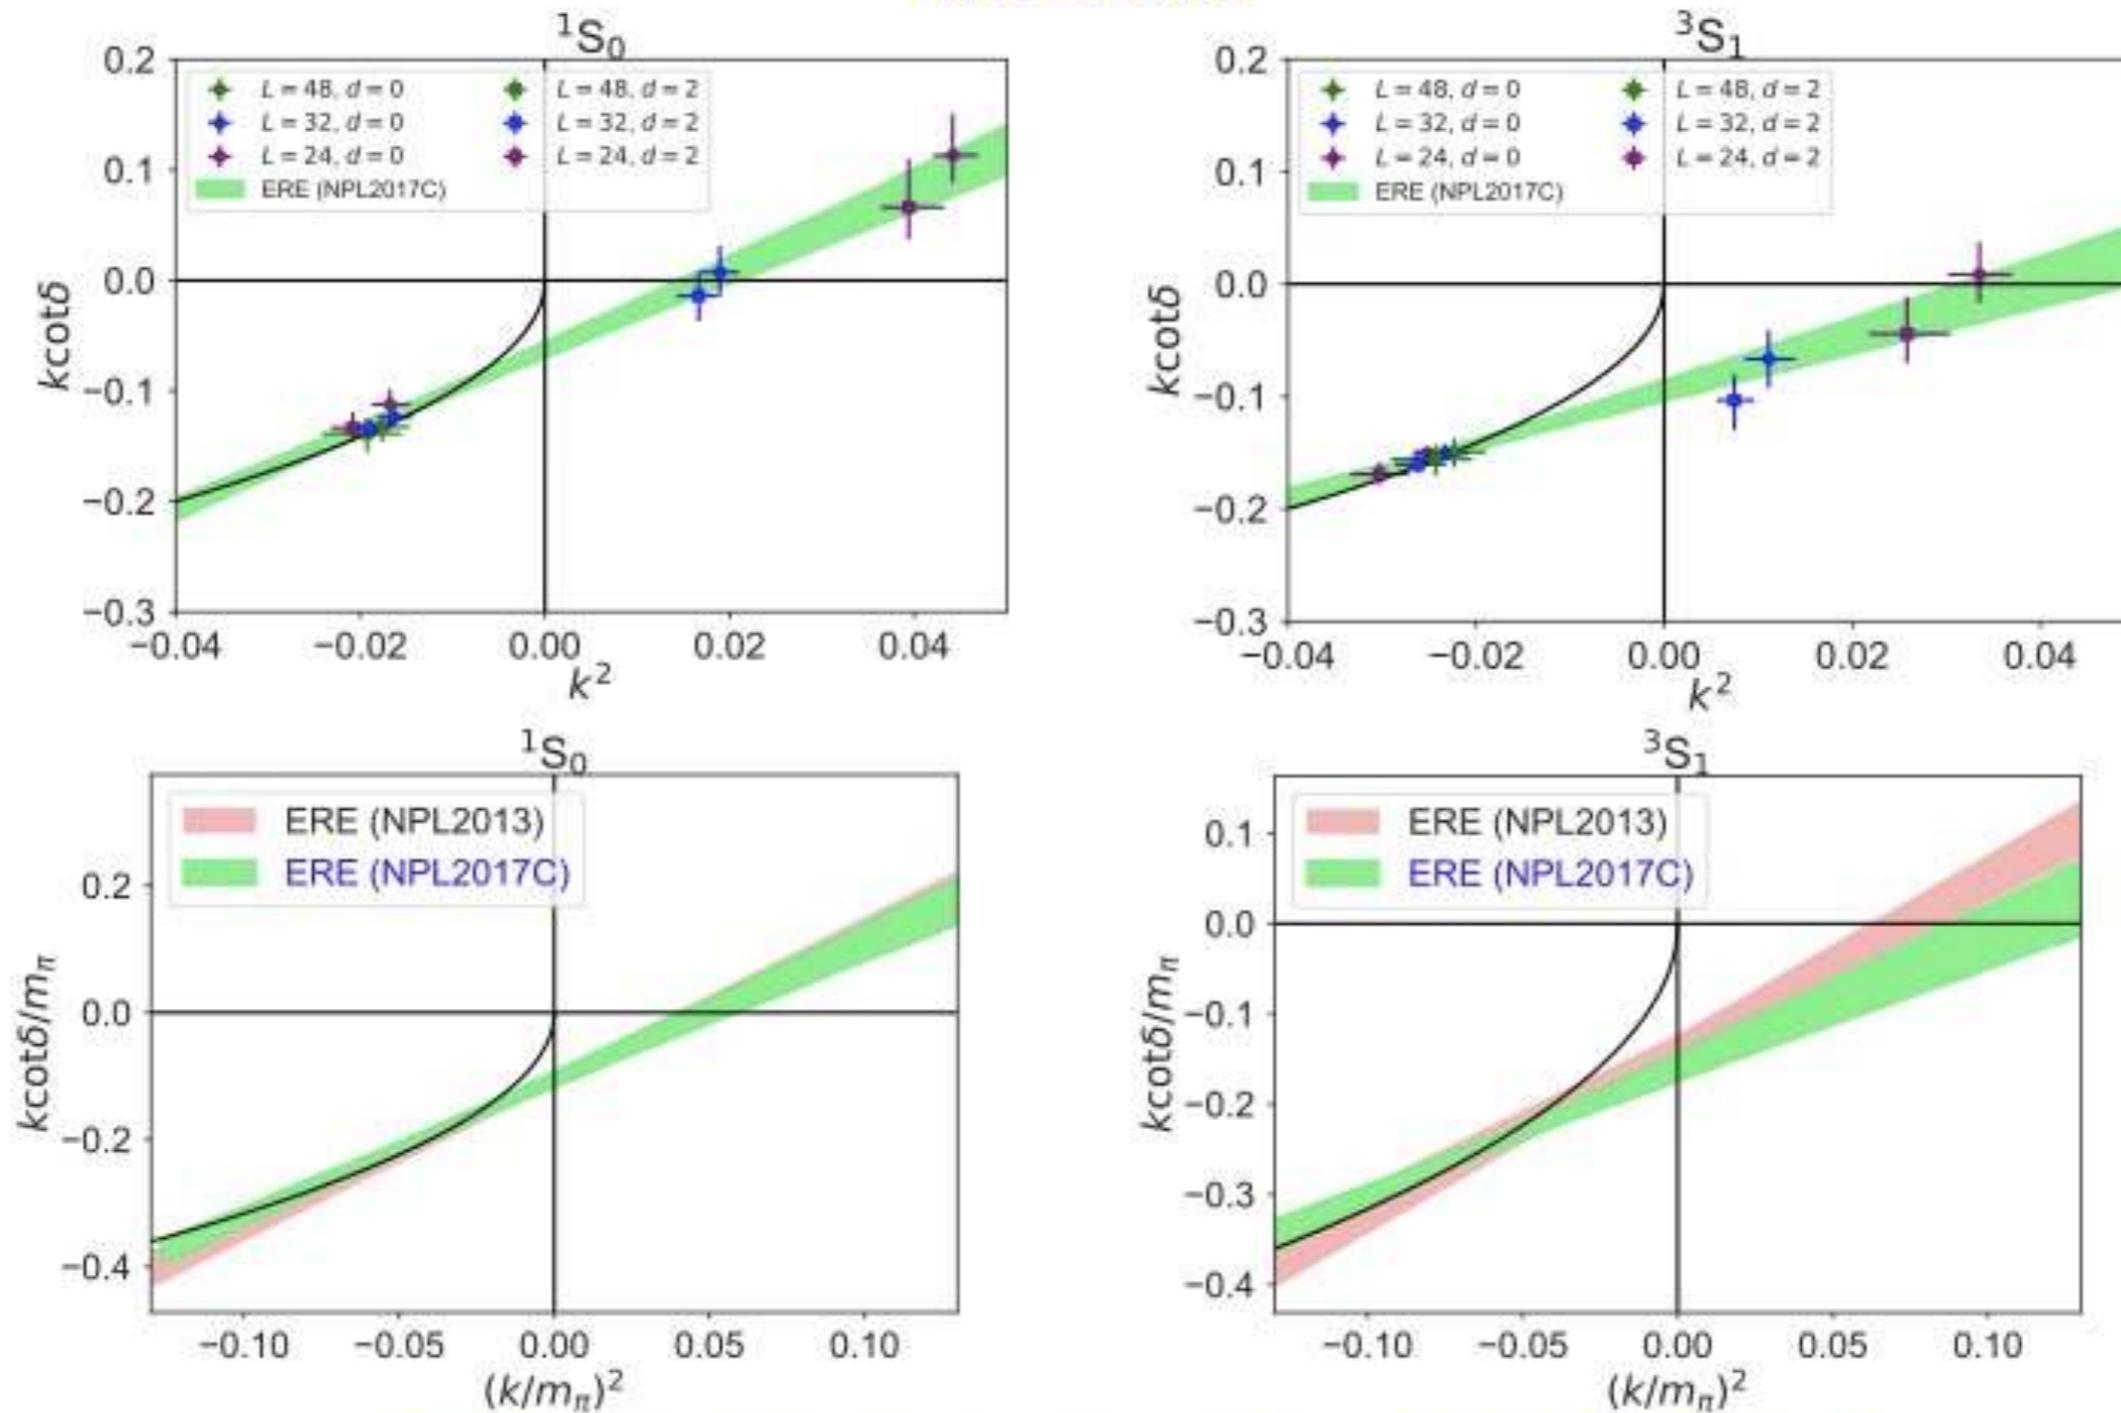

χ^2/dof	3.70	4.22	2.37	2.75
significance	0.05	0.04	0.12	0.10

It is fair to say that source independence is NOT established.

see talk by S. Aoki (Parallel, Hadron Spectroscopy and Interactions on Thur.)

On the comment on “sanity check” by NPLQCD

NPL2017C

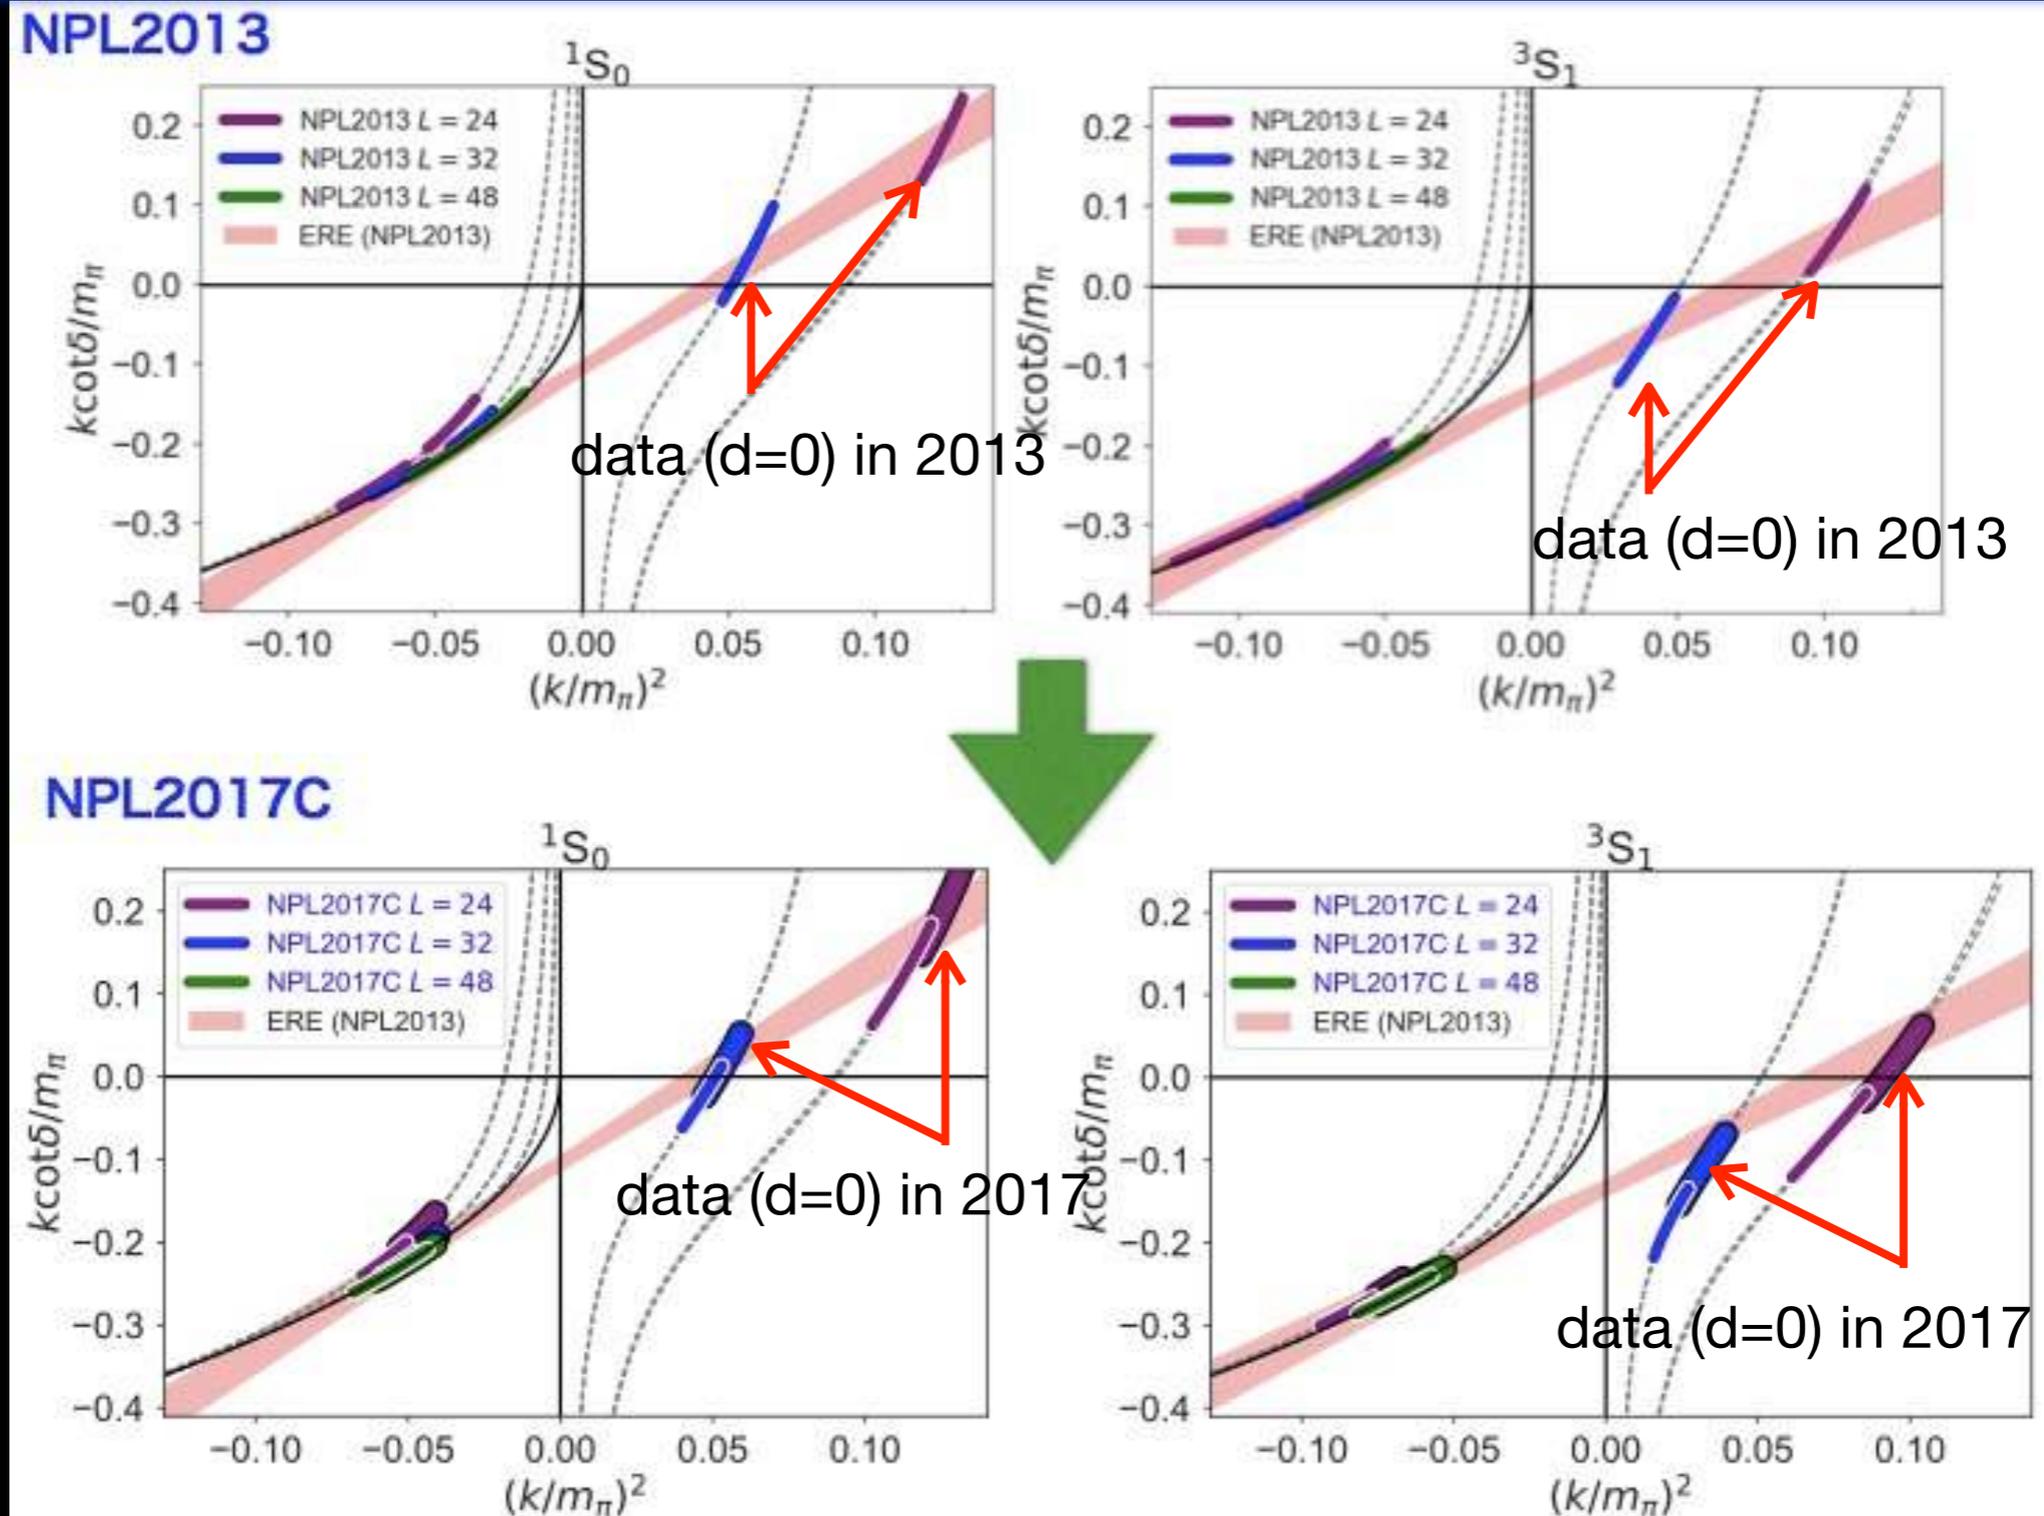

EREs look a little better than their original EREs. Why ?

An inclusion of data in the moving frame ($d=2$) affect ?

see talk by S. Aoki (Parallel, Hadron Spectroscopy and Interactions on Thur.)

On the comment on “sanity check” by NPLQCD

The data have been modified without being mentioned...

→ Our assessment to original NPL2013 data is valid

see talk by S. Aoki (Parallel, Hadron Spectroscopy and Interactions on Thur.)
